COVER LETTER

FEBRUARY 20, 2017

---

DEAR READER

I'm a Software Engineer that specializes in Ruby on Rails and React.

As my resume states, I began my career as a Controls Engineer developing software for industrial applications and user interfaces, I've worked in over 20 different projects all over the US and one in Australia. In the past year, I made the switch to Web Development by joining a coding boot camp where I picked up skills like JavaScript, React, Ruby, Ruby on Rails, SQL to name a few. The career change came from the need to grow and develop as an engineer and not get stuck working in only one field.

I have a passion for design and detailed oriented. I have a minimalist approach to design which makes my work have a clean aesthetic. One example is my most recent project, a full-stack single-page app [www.insta-shop.io](http://www.insta-shop.io) it pairs a Rails backend with a React front end to deliver data faster. I accomplished the styling by using SASS and Flexbox to optimize UX on mobile devices. Another recent project is Dots <https://victorguillen.github.io/Dots/> a JavaScript game written in HTML5 Canvas that is also compatible with mobile devices.

I believe that my years of experience in software development and educational background gave me a unique skillset and has prepared me well for a rewarding and challenging role.

SINCERELY,

Victor guillen
