Protected Through a Robust IP Portfolio

Protecting our business with **85 Patents and growing...**

Due to the nature of wireless connectivity, wearables at times will loose or not connect with a network and hence will need to store data and send it back to a host at a later date – this is called buffering.

The GTX Communication Protocol group of patents are central for these operations which are widely used today in most wearables that collect and send location data. This is the cornerstone of the GTX IP Portfolio and many of our patents were filed between 2002 and 2008 before the Wearable Tech industry emerged.

23 patents and/or pending applications with priority dates going back to 2002,
an acquired license for 62 external patents.

The Future Platform Location & Health

- + The **GPS or BLE SmartSole** is a wearable tracking and monitoring device that communicates the location of the wearer without user intervention.
- + The **GPS Smart Insole** eventually becomes a **communication platform** that supports bio-medical sensors; sending location and movement and in the near future will also send **vital signs and biometrics**, such as heart rate, pulse, weight and temperature. And monitor gait variability in order to predict falls.
- + Knowing **"Where is..."** along with **"How is"** his/her, gait, weight or heart rate is a game changing/life saving solution of the future.
