Are Hearing Aids Not Enough for You?

Find out what you can do to improve your hearing

By Cochlear (Full Content)

If you have hearing aids, you were likely fitted with the best aids at that time. You could hear your grandchildren laugh, your partner speeching to you from another room, and your arm in whatever you were doing. But, these aids do not make it all clear, especially in difficult environments.

Get the Facts

Experiencing hearing loss is common among seniors. In fact, nearly 2 out of every 3 adults over age 60 are affected by hearing loss. Here’s what you need to know:

- Hearing loss can’t be fixed, but hearing aids can make it easier. Hearing aids are designed to help you hear in the environment in which you live.
- Cochlear implants are devices that are surgically implanted in the inner ear. They can provide relief for some people who are deaf or hard of hearing.
- If hearing aids aren’t enough, consider a cochlear implant. Cochlear implants are a treatment option for people who are deaf or hard of hearing.

Where Are You in Your Hearing Loss Journey?

The first step is to finally check what hearing aid you have. What type of sensor are you using? Do you have a bone-anchored hearing aid? If you have a bone-anchored hearing aid, how do you want to hear? Do you want to hear in the environment? Take this short hearing test, and the results will help you decide if you should consider other options for better hearing.
