

Super lambing lick / Super lambing lick pellets

- Ideal supplement for ewes in late pregnancy and lactating ewes on any type of pasture
- Contains high levels of undegraded intake protein (bypass protein), which advances udder development and the production of colostrum and milk
- Excellent flush feed for ewes during the mating season to increase ovulation tempo and thus to also increase the lambing percentage
- Ideal supplement for the growth of young ewes
- Contains a vitamin and mineral premixture
- Has a low urea content which makes the product safe for small stock and young animals
- Suitable for use in Namibia
- Available in pellet form for better intake and less wastage

Recommended intake

- Feed as is without any further mixing
- Always feed in conjunction with sufficient hay or roughage
- Feed 250 g – 500 g per day to sheep

Composition

		Minimum	Maximum
Protein	g/kg	250	
Protein ex NPN	%		50
Urea	g/kg		30
Moisture	g/kg		120
Phosphorous	g/kg	6	
Calcium	g/kg	6	24
Fat	g/kg	15	50

Fibre	g/kg	50	90
-------	------	----	----

Warning:

This feed contains NPN (urea) and must be fed strictly according to the instructions. This lick is a supplement and not a complete feed, thus sufficient grazing and roughages should be available. Keep food troughs full, a constant daily intake will prevent over eating and urea poisoning. Before feeding an NPN-containing lick, first give a salt-phosphate lick for 7 days. Vitamin activity decreases with time. Consult the manufacturer or a nutritionist.
