PRESENTING COMPLAINTS

Dog bite wound

HISTORY

Today P was attacked by a dog that O was petsitting
The dog has previously been there with P before to pet sit. There was an incident in January where P was attacked but skin did not break.
The owner reports that while returning a dog she was pet-sitting to its owners, the pet-sitting dog became protective upon seeing the male owner and suddenly attacked the patient. The attacking dog reportedly wrapped its front limbs around the patient in a headlock-like manner and continuously bit the patient's head and neck region. The male owner attempted to intervene but was initially unsuccessful. Eventually, the attacking dog released the patient. At that point, the owner observed active bleeding from the patient's neck and also noted that the left eye had been dislodged from the socket, with the globe found a few feet away from the patient.
The owner came in and picked the dog's eye up and put it on ice.

No past medical history

VITALS

SYSTEM	INTAKE	LAST RECORDED	SYSTEM	INTAKE	LAST RECORDED
Mentation	QAR		Respiratory Effort	pant	
Mucous Membranes	pink		Respiratory Rate	80.0 BPM	
Heart Rate	120 BPM		Temperature	101.4 °F	
Capillary Refill Time	<2		Weight	10.2 KG	

INITIAL PHYSICAL EXAM

SYSTEM	INTAKE	NOTES
Abdomen	Normal	
Ears	Normal	
Eyes	Normal	left eye missing from globe with subcutaneous and fatty tissue visualized with blood, the right eye had scleritis and ruptured blood vessels
Heart	Normal	

SYSTEM	INTAKE	NOTES
Integument	Abnormal	multiple bite wounds on head and neck, indentation on right side of head where the bite wound is, swelling on face
Lungs	Normal

NOTES

July 06, 2025 at 10:56 AM

Progress Note

BG:110
Lactate:3.3
IVC placed and a bolus of Fentanyl of 3mcg/kg then started on a 4mcg/kg/hr CRI
Hypertonic Saline 4ml/kg over 10min

Radiographs:
Skull
– There is a fracture through the frontal bone (may be left-sided both difficult to see in the orthogonal projection) creating a large triangular-shaped
fragment which is moderately displaced rostrally and dorsally. This communicates with the frontal sinus. Moderate swelling of the rostral facial soft
tissues is noted at the level of the frontal sinus on the lateral projections. Remaining included osseous structures of the skull are normal.
– Included cervical spine is normal.
CONCLUSIONS:
. Frontal bone fracture with expected associated edema, hemorrhage. No additional fractures are identified as radiographs are insensitive at
detecting skull fractures due to superposition artifact, minimal displacement etc. Could consider head CT for best evaluation
2. Normal thorax
3. Aerophagia +/- functional ileus e.g. due to pain

Reviewed the poor prognosis. Discussed with O that P would likely need to be transferred to speciality due to the skull fracture and have a CT or MRI done and then evaluation of bite wounds and eye to have a procedure. Discussed that this could still end in euthanasia despite these efforts due to have clinically unstable P is. Discussed QOL. O elected to euthanize.

Due to concern for pet's declining quality of life and suffering, owners elected humane euthanasia.
Euthanized with 5ml propofol and 5ml euthasol IV
Confirmed no heart sounds on auscultation

TREATMENT SUMMARY

MEDICATION NAME	LAST ADMINISTERED	DOSE	ROUTE
Fentanyl 50 mcg/mL Injectable	07/06/25 09:32 AM	30.60 mcg	IV
Hypertonic Saline 7.2% Injectable	07/06/25 09:32 AM	41.00 ml	IV
Sodium PENTobarbital (Euthanasia) Inj	07/06/25 10:32 PM	6.00 ml	IV

EUTHANASIA AUTHORIZATION

I certify that I am the owner or the authorized representative of the pet described above, that I am 18 years of age or older, and that I give Veterinary Emergency Group consent to humanely euthanize the pet described above.

X Sydney Stepney DATE: July 6, 2025

I confirm that my pet did not bite anyone in the last 10 days. INITIAL: SS

AFTERCARE AUTHORIZATION - Choose One

_____ **Release Remains**: I will take my pet home for personal arrangements.

_____ **Communal Cremation**: My pet will be cremated communally by Agape Pet Services. The ashes will be scattered in a peaceful wooded area owned by the cremation facility. I will not receive my pet's ashes.

__X__ **Private Cremation**: My pet will be cremated individually by Agape Pet Services. I will receive my pet's ashes in an urn, sent by mail. (Please see the back of this form to choose your urn and other details.)

_____ **Hold**: My pet will be held at the veterinary facility for up to seven (7) days, pending my aftercare decision. I understand that if I do not contact Veterinary Emergency Group within this time period, my pet will be sent for General Cremation (as described above) and I will not receive the ashes.

I understand and consent to the aftercare selected above.

PRIVATE CREMATION URN SELECTION:

Please choose from the options provided:

☐ Decorative Metal Urn - Blue

☐ Decorative Metal Urn - Tan

☐ Scattering Tube

☐ Cedar Memorial Urn

☐ Hand-Carved Rosewood Urn

☐ Remembrance Urn

☒ Serenity Urn

☐ Satin pouch

HOME DELIVERY CONSENT:

I understand that my pet's ashes will be mailed to me in the urn selected above, to the address that I have provided. I will receive a tracking ID number from Agape Pet Services via email and understand that a signature will be required upon delivery. The estimated time of delivery is 7-10 business days.

X Sydney Stepney DATE: July 6, 2025

Please contact Agape Pet Services in Boonsboro, MD, between the hours of 8:00am-5:00pm for all custom arrangements or additional memorial products.

CLINICAL HISTORY / CLINICAL UPDATE FOR REPEAT STUDIES

Presented with bite wounds around head and neck. Left eye completely avulsed.

OBSERVATIONS :

Three-view thoracic radiographs and orthogonal views of the skull (6 images total)

FINDINGS:
Thorax
– Trachea and mainstem bronchi are normal.
– Cardiovascular structures are normal.
– Pulmonary parenchyma is normal.
– Normal mediastinum and pleural space.
– Stomach is mildly distended with gas and minimal amorphous soft tissue/fluid opaque material. Remainder of the minimally included abdomen is normal.
– Visible osseous structures are normal.

Skull
– There is a fracture through the frontal bone (may be left-sided both difficult to see in the orthogonal projection) creating a large triangular-shaped fragment which is moderately displaced rostrally and dorsally. This communicates with the frontal sinus. Moderate swelling of the rostral facial soft tissues is noted at the level of the frontal sinus on the lateral projections. Remaining included osseous structures of the skull are normal.
– Included cervical spine is normal.

CONCLUSIONS:
1. Frontal bone fracture with expected associated edema, hemorrhage. No additional fractures are identified as radiographs are insensitive at detecting skull fractures due to superposition artifact, minimal displacement etc. Could consider head CT for best evaluation
2. Normal thorax
3. Aerophagia +/- functional ileus e.g. due to pain
