

**All About Your EEG:
An Electroencephalogram**

I am going to the hospital.

**I will check in at the desk
and get a hospital wrist band.**

When I get to my room, there will be a bed.

I will then meet my nurse's helper who will make a new hat for me to wear during my visit.

My helper will use colorful strings to make my hat.

I have one very important job while my hat is being made. I will hold still!

Once I am cozy in bed, my helper will use a tape measure to know where to put the strings.

Next, my helper will use a special soap to clean the spots where the strings go. It will feel cool and wet.

My helper will use a white paste to help the strings stick to my head. The strings are soft. I can play a game or read a story to pass the time.

Next, my helper will use a soft white cloth to cover the strings. This is so they don't fall off when I play, eat and sleep.

My helper will cover the long strings with a white sock. They are attached to a small box that will be close by at all times.

**My helper will show me a bright flashing
light.**

I might have to blow a pinwheel. I'll do my best to make it go fast!

Once the doctor says my hat can come off, my hair will be washed. I did a great job!
