

<b>Complete solutions to Exercise 1(a)</b>
--

1. Very similar to **EXAMPLE 1**, thus

$$c = \sqrt{24^2 + 7^2} = \sqrt{625} = 25$$

2. Substituting  $R = 1000$  and  $V = 15$  into  $V = IR$  gives  
 $15 = 1000I$

$$I = \frac{15}{1000} = 15 \times 10^{-3} \text{ amp} = 15 \text{ mA}$$

3. Substituting the given values into  $P_1V_1 = P_2V_2$  yields

$$(5 \times 10^6) \times (2 \times 10^{-4}) = (2 \times 10^7) \times V_2$$

$$V_2 = \frac{(5 \times 10^6) \times (2 \times 10^{-4})}{2 \times 10^7} = 0.5 \times 10^{-4} \text{ m}^3$$

4. Substituting the given values into  $PV = nmRT$  yields

$$(5.6 \times 10^5) \times 0.015 = m(8.31 \times 34.6 \times 312)$$

$$m = \frac{(5.6 \times 10^5) \times 0.015}{8.31 \times 34.6 \times 312} = 0.094 \text{ kg (2 s.f.)}$$

5. Substituting  $s = 30$ ,  $u = 2$  and  $t = 5$  into  $s = ut + \frac{1}{2}at^2$  gives

$$(2 \times 5) + \left(\frac{1}{2}a \times 5^2\right) = 30$$

$$10 + 12.5a = 30$$

$$12.5a = 20$$

$$a = \frac{20}{12.5}$$

$$a = 1.6 \text{ m/s}^2$$

6. Substituting  $R_0 = 33$ ,  $R = 35$  and  $t = 89$  into  $R_0(1 + \alpha t) = R$  gives

$$33(1 + 89\alpha) = 35$$

$$1 + 89\alpha = \frac{35}{33} = 1.06$$

$$89\alpha = 1.06 - 1 = 0.060000$$

$$\alpha = \frac{0.06}{89} = 6.7 \times 10^{-4} / ^\circ\text{C (2 s.f.)}$$

7. Substituting  $R = 20$ ,  $E = 12$  and  $r = 1$  into  $E = \frac{V(R+r)}{R}$  gives

$$12 = \frac{V(20+1)}{20}$$

$$V = \frac{12 \times 20}{21} = 11.4 \text{ volt}$$

Questions 8-10 involve transposition of formulae similar to **EXAMPLES 4** and **5**.

8.(i)  $u = v - at$

(ii)  $a = \frac{v-u}{t}$

9.  $R = \frac{V}{I}$

$$10. T = \frac{PV}{mR}$$

---

11. Divide both sides by 100 to give

$$\frac{S}{100} = 1 - \frac{r\omega}{v}$$

We have

$$\frac{r\omega}{v} = 1 - \frac{S}{100}$$

$$r\omega = v\left(1 - \frac{S}{100}\right)$$

$$\omega = \frac{v}{r}\left(1 - \frac{S}{100}\right)$$

---
