

Logical reasoning

A dissertation is not so much about *what* you think, but about *how* you think. It is an examination of how we generate ideas, create and organise projects, gather evidence and then write a dissertation in which we create compelling arguments based on relevant and reliable evidence using language that is clear and consistent. So you will have demonstrated that you can reflect on your own thinking, critically evaluating it as you would any source that you might read. Your dissertation will show that you have the ability to think logically: that you can create consistent and persuasive arguments that are backed by reliable and relevant evidence
