Chapter 1 – Design

E1.1

- a. A tree trunk acts as a vertical cantilever beam to resist wind force. Roots transfer the load into the ground

- b. An apple stalk is a tension member transferring the weight of the apple back to the tree. Vines and trailing plants are also tension structures

- c. Creatures such as crabs have exo-skeletons. This is a "shell" structure which provides the strength and shape on the outside of the flesh.

- d. Step ladders are an example of a structure to transfer the weight of a person down to the ground. The feet are prevented from moving apart partly by the tensile rope and partly by friction on the ground.

- e. A bed is a similar structure to a bridge and consists of a beam spanning between compressive columns.

- f. The shelf bracket transfers the load back to the wall with the help of screws. The diagonal member is a compressive 'strut' and reduces bending in the bracket.

E1.2

a1. Steel lattice tower with tension guys.

a2. Concrete shell with restaurant.

b1. Shell dome with flying buttresses.

b2. Cable-supported 'tent' roof (cross-section)

E1.3

Stage 1 – site survey

Determine the most suitable point to cross the stream taking into account:

- Stream width
- Height of banks
- Foundation material (any mid-stream rocks for extra support?)
- Location of access roads.

Carry out a detailed survey and produce a cross-section of the chosen point – drawn to scale:

Stage 2 – alternative concepts

Comments:

- Best appearance and long life, but expensive and difficult,
- Reasonably good appearance, fairly cheap and easy but possibly short life,
- Robust and easy but requires maintenance for long life,
- Least attractive but cheap and easy.

Choose say b.

Stage 3 – detailed development

Stage 4 - Assessment of loads

This can be tricky and very much depends upon who has access to the bridge. Is it accessible by the public and emergency vehicles? If this is the case the bridge will need to be designed for loads specified in Eurocode 1-2. If the bridge merely provides a link between two fields and will only be used by the farmer for movement of animals and a tractor and trailer the load requirements may be more relaxed. The local building regulation authority should be contacted for advice.

Assuming use by only the farmer:

Animals: Design for say the number of cows that can fit on the bridge x weight of one cow. (about 1000 kg each?). Side load, P , on the handrail might be 20% of cow weight?

Vehicles: The highest axle loads should be placed at various points in the span.

Stage 5 Analysis

Structural model:

Stage 6 – detail design

possible failure modes:

E1.4

a. Permissible stress design

$$\begin{aligned}\text{Total load in rod} &= 12 + 16 = 28 \text{ kN} \\ \text{Area required} &= \text{force/stress} = 28 \times 10^3 / 150 \\ &= \mathbf{187 \text{ mm}^2}\end{aligned}$$

b. Limit state design

$$\begin{aligned}\text{Design permanent load} &= 12 \times 1.35 = 16.2 \text{ kN} \\ \text{Design variable load} &= 16 \times 1.5 = \underline{24.0 \text{ kN}} \\ \text{Total design load} &= 40.2 \text{ kN} \\ \text{Design strength} &= f_y / \gamma_M = 275 / 1.0 = 275 \text{ N/mm}^2 \\ \text{Area required} &= 40.2 \times 10^3 / 275 = \mathbf{146 \text{ mm}^2}\end{aligned}$$

Chapter 2 - Basics

E2.1

Figure 2.15
Traction weights in kg

a. Force from 2.0 kg weight = $2.0 \times 9.81 = \underline{\underline{19.6 \text{ N}}}$
 Force from 3.5 kg weight = $3.5 \times 9.81 = \underline{\underline{34.3 \text{ N}}}$

b. Horizontal component of force = $34.3 \cos 30^\circ = \underline{\underline{29.7 \text{ N} \leftarrow}}$
 Vertical component of force = $19.6 + 34.3 \sin 30^\circ = \underline{\underline{36.8 \text{ N} \uparrow}}$
 c. Magnitude of resultant force = $\sqrt{(29.7^2 + 36.8^2)} = \underline{\underline{47.3 \text{ N}}}$
 Direction of resultant force = $\tan^{-1}(36.8/29.7) = \underline{\underline{51.1^\circ}}$

d. Stress in cable = Force/Area = $34.3 / (\pi \times 1.5^2 / 4)$
 = $\underline{\underline{19.4 \text{ N/mm}^2}}$

E2.2

Figure 2.16
Pin-jointed structure

a. $F_{CH} = 20 \cos 30^\circ = 17.32 \text{ kN}$

$F_{CV} = 20 \sin 30^\circ = 10.0 \text{ kN}$

b.

Support B is a roller $\therefore R_{BH} = 0$

ΣM about A

$$(17.32 \times 0.75) + (10 \times 3.5) = R_{BV} \times 2.0$$

$$R_{BV} = \underline{\underline{24.0 \text{ kN}\uparrow}}$$

$\Sigma H = 0$

$$R_{AH} = \underline{\underline{17.32 \text{ kN}\leftarrow}}$$

$\Sigma V = 0$

$$10.0 + R_{AV} = 24.0 \text{ kN}$$

$$R_{AV} = \underline{14.0 \text{ kN}\downarrow}$$

E2.3

No horizontal forces or reactions

a. ΣM about A

$$10 \times 3 = 5 \times R_A$$

$$R_A = \underline{6 \text{ kN}\uparrow}$$

$$\Sigma V = 0$$

$$10 = 6 + R_C$$

$$R_C = \underline{4 \text{ kN}\uparrow} \text{ i.e. tension in rod}$$

Figure 2.17
Beam and tie structure

structural model:

b. Area of rod = $\pi \times 10^2 / 4 = 78.5 \text{ mm}^2$

Stress = force/area = $4 \times 10^3 / 78.5 = \underline{51 \text{ N/mm}^2}$

c. Extension, $\delta = FL/EA$ where $E = 205 \text{ kN/mm}^2$

$$\delta = 4 \times 10^3 \times 3000 / 205\,000 \times 78.5 = \underline{0.75 \text{ mm}}$$

Chapter 3 - Materials

E3.1

a. Underground water storage reservoir

Choice: Reinforced concrete

Reasons:

- Will resist bending from water pressure
- Can be made waterproof with additives
- Durable and requires no maintenance if cover to reinforcement adequate
- Relatively cheap
- Can be formed on-site from locally available materials

b. Footbridge in chemical plant

Choice: Fibre composite

Reasons:

- Resistant to chemical attack
- No maintenance required
- Lightweight and easily transported

c. Portable grandstand

Choice: Aluminium alloy

Reasons:

- Lightweight and easily transported
- Good range of extrusions available
- Can be welded
- Can be painted or anodised for good corrosion protection
- Stiffer than fibre composite

E 3.2

- a. Yield stress, f_y , and Modulus of elasticity, E
- b. Gauge length is the initial length of the specimen for the purposes of measuring extension and hence strain and modulus of elasticity.
- c. Plastic behaviour means that materials are ductile. (i.e. they can be deformed by large amounts without losing their strength. The opposite of brittle.
- d. Because by the time mild steel has reached its ultimate strength it will have deformed excessively. Keeping below the yield strength means that permanent deformations do not take place.
- e. Yield point (i.e. start of plastic behaviour), limit of proportionality (i.e. end of linear behaviour where strain is proportional to stress) and elastic limit (i.e. end of reversible deformation).

E3.3

Area of specimen = $\pi/4 \times 5^2 = 19.63 \text{ mm}^2$
 Stress = load/area
 % Strain = 100 x extension/gauge length

| Load (kN) | Extension (mm) | Stress (N/mm ²) | % Strain |
|-----------|----------------|-----------------------------|----------|
| 0.00 | 0.00 | 0 | 0.000 |
| 1.00 | 0.01 | 51 | 0.025 |
| 2.00 | 0.02 | 102 | 0.050 |
| 3.00 | 0.03 | 153 | 0.075 |
| 4.00 | 0.04 | 204 | 0.100 |
| 5.00 | 0.05 | 255 | 0.125 |
| 5.32 | 0.06 | 271 | 0.150 |
| 5.38 | 0.07 | 274 | 0.175 |
| 5.34 | 0.08 | 272 | 0.200 |

From graph:

- a. Yield stress, f_y = 274 N/mm²
 b. Modulus of elasticity, E = $204/0.001 = \underline{204\,000 \text{ N/mm}^2}$

E3.4

| Result (x) | $(x-x_m)$ | $(x-x_m)^2$ |
|----------------|-----------|-------------|
| 455 | -4 | 16 |
| 467 | 8 | 64 |
| 449 | -10 | 100 |
| 452 | -7 | 49 |
| 471 | 12 | 144 |
| <u>462</u> | 3 | <u>9</u> |
| 2756 | | 382 |

$$\begin{aligned}\text{Mean } x_m &= 2756/6 = 459 \\ \text{Standard deviation} &= \sqrt{[(x-x_m)^2/(n-1)]} = 382/5 \\ &= 8.74 \\ \text{Characteristic strength} &= 459 - 1.59 \times 8.74 \\ &= 445 \text{ N/mm}^2 \\ \text{Design strength} &= \text{Characteristic strength}/\gamma_M \\ &= 445/1.15 = \underline{\underline{387 \text{ N/mm}^2}}\end{aligned}$$

Chapter 4 - Loads

E4.1

| | | |
|--|---|-------------------------------------|
| From <i>table 4.1</i> unit weight of steel | = | 70 kN/m ³ |
| ∴ Weight of of 1 square meter of plate 6 mm thick | = | 70 x 0.006 = 0.42 kN/m ² |
| a. Characteristic permanent load | = | <u>0.42 kN/m²</u> |
| b. From <i>table 4.3</i> variable floor load for factory | = | 5.0 kN/m ² |
| ∴ Total design load | = | (1.35 x 0.42) + (1.5 x 5.0) |
| | = | <u>8.07 kN/m²</u> |

E4.2

a.

Resultant occurs at centroid of triangle i.e. 1/3rd of height.

| | | | | |
|-------------------|---|---------------|---|------------------|
| a. Force | = | 38.25 x 4.5/2 | = | <u>86.1 kNm</u> |
| b. Bending moment | = | 86.1 x 1.5 | = | <u>129.2 kNm</u> |

E4.3

| | | | | |
|---|---|--|---|---------------------|
| Area of each floor | = | 60 x 60 | = | 3600 m ² |
| From <i>table 4.1</i> Wt. of floor/m ² | = | 25 x 0.2 | = | 5 kN/m ² |
| Wt. of one entire floor | = | 3600 x 5 | = | 18 000 kN |
| Wall area per storey | = | 4 x 4 x 60 | = | 960 m ² |
| Weight of wall per storey | = | 960 x 1.0 | = | 960 kN |
| Total permanent load/storey | = | 18 000 + 960 | = | 18 960 kN |
| From <i>table 4.3</i> Variable load per floor | = | 3600 x 2.5 | = | 9000 kN |
| Total design load | = | 110 x [(1.35 x 18 960) + (1.5 x 9000)] | | |
| | = | <u>4.30 x 10⁶ kN</u> | | |

E4.4

The following is for a 1 m wide strip of the floor (into the page):

| | | | | |
|--|---|------------------|---|------------|
| From <i>table 4.1</i> Permanent load of wall | = | 22 x 0.215 x 1.0 | = | 4.73 kN/m |
| Design permanent wall load | = | 4.73 x 1.35 | = | 5.81 kN/m |
| Permanent load of slab | = | 25 x 0.3 | = | 7.5 kN/m |
| Design permanent slab load | = | 1.35 x 7.5 | = | 10.1 kN/m |
| From <i>table 4.3</i> Variable load on slab | = | 2.5 kN/m | | |
| Design variable load | = | 1.5 x 2.5 | = | 3.75 kN/m |
| Total slab design load | = | 10.1 + 3.75 | = | 13.85 kN/m |

Structural model

Load on beam is reaction at A - take moments about B:

$$R_A \times 8.0 = (5.81 \times 9.8) + (13.85 \times 9.8 \times 9.8/2)$$

$$R_A = 90.25 \text{ kN/m}$$

| | | | | |
|----------------------------|---|-----------------------------------|---|------------|
| Design self-weight of beam | = | 140 x 9.81/10 ³ x 1.35 | = | 1.9 kN/m |
| Total design load on beam | = | 90.25 + 1.9 | = | 92.15 kN/m |

Chapter 5 – Pin-jointed trusses

E5.1

E5.2

E5.3

Consider only the left-hand-side of the cut:

ΣM about E for F_{BC} :

$$F_{BC} \times y_E = R_A \times 8$$

$$F_{BC} \times 4.85 = 260 \times 8$$

$$F_{BC} = \underline{\underline{429 \text{ kN compression}}}$$

ΣM about x for F_{CE} :

$$(180 \times 20) = (260 \times 12) + (F_{CE} \times 16.64)$$

$$F_{CE} = \underline{\underline{28.8 \text{ kN tension}}}$$

E5.4

- $m = 13, j = 6 \therefore i(1)$
- $m = 11, j = 5$ + reduced roller support, but formula doesn't work – actually $m + i(1)$
- $m = 16, j = 8$ extra roller $\therefore i(1)$
- $m = 8, j = 4 \therefore s$
- $m = 11, j = 5 \therefore i(1)$

Chapter 6 - Tension

E6.1

From text: $f_y = 275 \text{ N/mm}^2, f_u = 410 \text{ N/mm}^2$

$$\gamma_{M0} = 1.0, \gamma_{M2} = 1.1$$

Option a)

$$\text{Min. } A_{\text{gross}} = \frac{150 \times 10^3}{1.0} = 545 \text{ mm}^2$$

$$A_{\text{net}} = \frac{\frac{150 \times 10^3}{0.9 \times 410}}{1.1} = 447 \text{ mm}^2$$

$$W = 447/5 + 22 = 111.4 \text{ say } 115 \text{ mm}$$

$$A_{\text{gross}} = 115 \times 5 = \underline{575 \text{ mm}^2} > 545 \text{ mm}^2$$

Option b)

$$A_{\text{gross}} = \underline{545 \text{ mm}^2} \text{ as above}$$

From *appendix* **use 60 x 60 x 5 Angle** ($A = 582 \text{ mm}^2$)

E6.2

From symmetry consider only half of the structure:

a.

$$\theta = \tan^{-1}(2/3) = 33.7^\circ$$

From vertical equilibrium:

vertical component of force $F_2 = 2 \text{ kN}$

$$\therefore F_2 \sin 33.7^\circ = 2.0$$

$$\text{Force in cable at support, } F_2 = \underline{\underline{3.60 \text{ kN}}}$$

From horizontal equilibrium:

$$\text{Force in cable at midspan, } F_1 = 3.60 \cos 33.7^\circ = \underline{\underline{3.00 \text{ kN}}}$$

b.

$$\text{Area of cable required} = 3600 / (1200/5) = 15 \text{ mm}^2$$

$$\text{Diameter} = \sqrt{(15 \times 4 / \pi)} = 4.4 \text{ mm}$$

Use 5mm diameter cable

E6.3

$$\begin{aligned} \text{Total design load} &= (1.35 \times 6) + (1.5 \times 5 \times 2) \quad [\text{where 2 is the width}] \\ &= 23.1 \text{ kN/m} \end{aligned}$$

Diagram identical for both main span and side-spans

$$[6.4] \quad R_V = wL/2 = 23.1 \times 64/2 = 739 \text{ kN}$$

$$[6.5] \quad R_H = wL^2/8D = (23.1 \times 64^2)/(8 \times 15) = 788 \text{ kN}$$

$$a. \quad \text{Max cable force at support} = 0.5 \times \sqrt{(739^2 + 788^2)} = \underline{\underline{540 \text{ kN}}}$$

[0.5 above is because of two cables]

$$\begin{aligned} b. \quad \text{Compressive force in tower} &= \text{vert. component in cables at each side} \\ &= 2 \times 739 = \underline{\underline{1478 \text{ kN}}} \end{aligned}$$

$$\begin{aligned} c. \quad \text{Area of cable required} &= \text{Force}/(\text{strength}/\gamma_M) = 540 \times 10^3/(1590/3) \\ &= 1019 \text{ mm}^2 \end{aligned}$$

$$\text{Diameter} = \sqrt{[(4 \times 1019)/\pi]} = 36.02 \text{ mm}$$

say 40 mm

$$d. \text{Horizontal force on cable anchor} = R_H/2 = 788/2 = \underline{\underline{394 \text{ kN}}}$$

E6.4

$$\text{Design variable load from one light} = 2.5 \times 1.5 \times 9.81 = 368 \text{ N}$$

a.

ΣM about A

$$(368 \times 1.3) + (368 \times 4.7) = (368 \times 0.7) + (R_B \times 4.4)$$

$$R_B = \underline{443 \text{ N}}$$

$\Sigma V = 0$

$$R_A = (3 \times 368) - 443$$

$$R_A = \underline{661 \text{ N}}$$

b.

$$\text{Area of wire required} = 661 / (300/5) = 11.01 \text{ mm}^2$$

$$\text{Diameter of wire} = \sqrt{[(4 \times 11.01) / \pi]} = 3.75 \text{ say } \underline{4.0 \text{ mm}}$$

Chapter 7 - Beams

E7.1

ΣM about A

$$(5 \times 5.5 \times 1.25) + (15 \times 6) = R_B \times 4$$

$$R_B = 31.1 \text{ kN.}$$

$\Sigma V = 0$

$$R_A = (5 \times 5.5) + 15 - 31.1$$

$$= 11.4 \text{ kN.}$$

$$x = 1.5 + \frac{3.9}{5} = 2.28 \text{ m}$$

$$M_x = (11.4 \times 0.78) - (5 \times 2.28 \times \frac{2.28}{2})$$

$$= -4.1$$

Not really relevant as it is a min. not a max.

ΣM about A

$$(5 \times 2.7 \times 1.35) + (7 \times 2.7) = (3 \times 1.5) + (R_B \times 4.1)$$

$$R_B = 8.0 \text{ kN.}$$

$\Sigma V = 0$

$$3 + (5 \times 2.7) + 7 = R_A + 8.0$$

$$R_A = 15.5 \text{ kN.}$$

$$x = 1.5 + \frac{12.5}{5}$$

$$= 4.0 \text{ m}$$

$$M_x = (8 \times 1.6) - (7 \times 0.2) - (5 \times 0.2 \times \frac{0.2}{2})$$

$$= 11.3 \text{ kNm}$$

E7.2

$$\begin{aligned} \text{Bending moment} &= w l^2 / 8 = 22 \times 8.0^2 / 8 = 176 \text{ kNm} \\ f_y &= 275, \quad \gamma_M = 1.0 \\ \therefore \text{required } W_{pl} &= (176 \times 10^6) / (275 \times 10^3) = 640 \text{ cm}^3 \end{aligned}$$

Use 406 x 140 x 39 kg/m Universal Beam

E7.3

a.

$$\begin{aligned} \text{Total area} &= 9 + 6 + 6 \\ &= 21 \text{ cm}^2 \\ \text{Half area} &= 21/2 \\ &= 10.5 \text{ cm}^2 \end{aligned}$$

For the plastic modulus the neutral axis divides the total area into two equal parts.

$$Y = 1.0 + (10.5 - 6) / 0.8 = 6.625 \text{ cm}$$

| Item | A (cm ²) | Y (cm) | Ay (cm ³) |
|------|----------------------|--------|-----------------------|
| 1 | 9 | 3.375 | 30.3 |
| 2 | 1.5 | 0.938 | 1.4 |
| 3 | 4.5 | 2.813 | 12.7 |
| 4 | 6 | 6.125 | <u>36.8</u> |
| | | | 81.3 |

Plastic modulus, $W_{pl} = 81.3 \text{ cm}^3$

b.

$$\begin{aligned} \text{Design load} &= (1.35 \times 0.9) + (1.5 \times 3.5) = 6.47 \text{ kN/m}^2 \\ \text{Design load/m, } w &= 6.47 \times 0.35 = \underline{\underline{2.26 \text{ kN/m}}} \end{aligned}$$

c.

$$\begin{aligned} \text{Design bending moment} &= w l^2 / 8 = 2.26 l^2 / 8 && \textcircled{1} \\ \text{Design resistance moment} &= W_{pl} \times f_y = 81.3 \times 275 / 10^3 && \\ &= 22.36 && \textcircled{2} \end{aligned}$$

Equating ① and ②

$$\begin{aligned} 2.26 l^2 / 8 &= 22.36 \\ \underline{\underline{l_{max}}} &= \underline{\underline{8.9 \text{ m}}} \end{aligned}$$

E7.4

a. Design load = $10 \times 1.5 = \underline{15 \text{ kN}}$

Lever arm, $l = 0.8 \cos 45^\circ = 0.566 \text{ m}$

ΣM about A:

$15 \times 1.7 = F_{BD} \times 0.566$
 Force in ram, $F_{BD} = \underline{45.1 \text{ kN}}$

ΣM about E:

$15 \times 1.7 = R_F \times 2.2$
 $R_F = \underline{11.59 \text{ kN}}$

$\Sigma V = 0:$

$15 = 11.59 + R_E$
 $R_E = \underline{3.41 \text{ kN}}$

c.

$M_{\max} = 15 \times 0.9 = 13.5 \text{ kNm}$

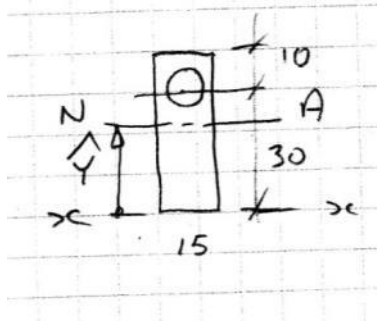

$W_{pl} \text{ required} = (13.5 \times 10^6) / (275 \times 10^3)$
 $= 49.1 \text{ cm}^3$

From appendix:

Use 100 x 100 x 4.0 square hollow section ($W_{pl} = 54.9 \text{ cm}^3$)

E7.5

| Part | Area (mm ²) | y _n | A y _n | y | Ay ² | I _{self} |
|-----------|-------------------------|----------------|------------------|-------|-----------------|-------------------|
| Rectangle | 600 | 20 | 12000 | 1.51 | 1368 | 80 000 |
| Hole | <u>-78.5</u> | 30 | <u>-2355</u> | 11.51 | <u>-10400</u> | <u>-491</u> |
| | 521.5 | | 9645 | | -9032 | 79 509 |

$$Y = 9645/521.5 = 18.49$$

$$I_{NA} = 79\,509 - 9032 = 70\,477 \text{ mm}^4$$

$$W_{el,top} = 70\,477 / (40 - 18.49) = 3276 \text{ mm}^3$$

$$W_{el,bottom} = 70\,477 / 18.49 = 3812 \text{ mm}^3$$

$$\sigma_{top} = 0.5 \times 10^6 / 3276 = \underline{\underline{153 \text{ N/mm}^2 \text{ compression}}}$$

$$\sigma_{bottom} = 0.5 \times 10^6 / 3812 = \underline{\underline{131 \text{ N/mm}^2 \text{ tension}}}$$

E7.5

a. Effective depth, $d = 450 - 30 - 12.5 = 407.5 \text{ mm}$

Based on concrete:

$$M_{ult} = 0.214 f_{ck} b d^2 = 0.214 \times 30 \times 200 \times 407.5^2 \times 10^{-6}$$

$$= 213.2 \text{ kNm}$$

Based on reinforcement:

Table 3.1 Area of steel = 2 x 491

$$= 982 \text{ mm}^2$$

$$M_{ult} = 0.696 A_s f_{yk} d = 0.696 \times 982 \times 500 \times 407.5 \times 10^{-6}$$

$$= 139.3 \text{ kNm}$$

But $M_{Ed} = w l^2 / 8 = 40^2 / 8$

$$\therefore l = \sqrt{8 \times 139.3 / 40} = \underline{\underline{5.28 \text{ m span}}}$$

b. Shear force on beam, $V_{Ed} = 5.28 \times 40 / 2 = 105.6 \text{ kN}$

Design shear stress, $v_{Ed} = 105.6 \times 10^3 / (200 \times 407.5) = 1.30 \text{ N/mm}^2$

$$\begin{aligned}
 \% \text{ reinforcing steel} &= 100 A_s / bd \\
 &= 100 \times 982 / (200 \times 407.5) = 1.2 \\
 \text{Interpolating from table 7.2} \quad v_{Rd,c} &= 0.71 \text{ N/mm}^2 < 1.30 - \therefore \text{shear links required} \\
 \text{New, } v_{ED} &= 105.6 \times 10^3 / (200 \times 407.5 \times 0.9) \\
 &= 1.44 \text{ N/mm}^2 \\
 \text{From table 7.3 (cot } \theta = 2.5) \quad v_{Rd,max} &= 5.28 > 1.30 \\
 \therefore A_{sw} &= v_{Ed} s b / 1087 = 1.44 s b / 1087 \\
 \text{Max link spacing, } s &= 0.75 \times 407.5 = 305.6 \\
 &\text{Say } = 300 \text{ mm} \\
 \therefore A_{sw} &= 1.44 \times 300 \times 200 / 1087 \\
 &= 79.5 \text{ mm}^2
 \end{aligned}$$

From table 3.1 **Use 8 mm dia. Links at 300 mm spacing** ($A_{sw} = 100 \text{ mm}^2$)

Chapter 8 - Compression

E8.1

From *equation 8.1* $N_{Rd} = f_{ck}/\gamma_c \times b \times h_w \times (1 - 2e/h_w)$

Where: Eccentricity, $e = l_w/400 = 3750/400$
 $= 9.4 \text{ mm}$

$\therefore N_{Rd} = 40/1.5 \times 400 \times 400 \times (1 - 2 \times 9.4/400) \times 10^{-3}$
 $= \underline{\underline{4066 \text{ kN}}}$

E8.2

For 10mm x 10mm strut, $I = bd^3/12 = 10 \times 10^3/12 = 833 \text{ mm}^4$

For steel, $E = 210\,000 \text{ N/mm}^2$

Euler buckling load, $P_{crit} = \pi^2 EI/L^2 = \pi^2 \times 210\,000 \times 833/900^2$
 $= \underline{\underline{2130 \text{ N}}}$

E8.3

Design load $= 250/2 \times 1.5 = 187.5 \text{ kN}$

Approximate area $= 187.5 \times 10^3 / 100 \times 10^2 = 18.7 \text{ cm}^2$

From *appendix* Try 114.3 x 6.3 circular hollow section ($A = 21.4 \text{ cm}^2$, $i = 3.82 \text{ cm}$)

Effective length $= 3500 \times 2 = 7000 \text{ mm}$

Non-dimensional slenderness, $\lambda = 7000/(86 \times 38.2) = 2.13$

From *fig 7.38* $\chi = 0.18$

Buckling stress $= 275 \times 0.18 = 49.5 \text{ N/mm}^2$

Actual stress $= 187.5 \times 10^3 / 21.4 \times 10^2 = 87.6 \text{ N/mm}^2$

– no good

From *appendix* Try 168.3 x 5.0 circular hollow section ($A = 5.7 \text{ cm}^2$, $i = 5.78 \text{ cm}$)

$$\begin{aligned}
 \text{Non-dimensional slenderness, } \lambda &= 7000 / (86 \times 57.8) = 1.4 \\
 \text{From fig 7.38 } \chi &= 0.38 \\
 \text{Buckling stress} &= 275 \times 0.38 = 104.5 \text{ N/mm}^2 \\
 \text{Actual stress} &= 187.5 \times 10^3 / 25.7 \times 10^2 = 73 \text{ N/mm}^2 \checkmark
 \end{aligned}$$

Use 168.3 x 5.0 circular hollow section

Chapter 9 – Combined axial and bending stresses

E9.1

$$\begin{aligned} \text{Axial load, } N_{Ed} &= 675 + 450 + 590 \\ &= 1715 \text{ kN} \end{aligned}$$

$$\begin{aligned} \text{Approx. area required} &= 1715 \times 10^3 / 100 \times 10^2 \\ &= 172 \text{ cm}^2 \end{aligned}$$

Try 305 x 305 x 137 Universal Column
 ($A = 175 \text{ cm}^2$, $W_{pl,y} = 2300 \text{ cm}^3$, $W_{pl,z} = 1052 \text{ cm}^3$, $i_z = 7.82 \text{ cm}$,
 $h = 320.5$, $t_f = 13.8$)

Dimensions as shown

$$\begin{aligned} M_{y,Ed} &= (675 - 590) \times (0.160 + 0.1) \\ &= 22.1 \text{ kNm} \end{aligned}$$

$$\begin{aligned} M_{z,Ed} &= 450 \times (0.007 + 0.1) \\ &= 48.2 \text{ kNm} \end{aligned}$$

$$\begin{aligned} \text{Non-dimensional slenderness ratio, } \lambda &= L_E / (86 \times i_z) = 6000 / (86 \times 78.2) \\ &= 0.89 \end{aligned}$$

From [9.2]

$$\frac{N_{Ed}}{A \chi f_y} + \frac{M_{y,Ed}}{\chi_{LT} f_y W_{pl,y}} + \frac{M_{z,Ed}}{f_y W_{pl,z}} < 1.0$$

From fig 7.38 $\chi = 0.55$

Buckling stress = $0.55 \times 275 = 151 \text{ N/mm}^2$

Bending stress = $0.55 \times 275 = 151 \text{ N/mm}^2$

\therefore Axial resistance, $A \chi f_y = 175 \times 151 \times 10^{-1} = 2642 \text{ kN}$

y-y bending resistance, $\chi_{LT} f_y W_{pl,y} = 151 \times 2300 \times 10^{-3} = 347 \text{ kNm}$

z-z bending resistance, $f_y W_{pl,z} = 275 \times 1052 \times 10^{-3} = 289 \text{ kNm}$

substitute into equation [9.2]

$$\frac{1715}{2642} + \frac{22.1}{347} + \frac{48.2}{289} = 0.963 < 1.0 \checkmark$$

Use 305 x 305 x 137 Universal Column

E9.2

a.

| Item | Area (cm ²) | y _n (cm) | A y _n | y | Ay ² | I _{self} |
|------|-------------------------|---------------------|------------------|------|-----------------|-------------------|
| 1 | 4.0 | 9.5 | 38 | 5.48 | 120 | - |
| 2 | 6.4 | 5.0 | 32 | 0.98 | 6 | 34 |
| 3 | <u>8.0</u> | 0.5 | <u>4</u> | 3.52 | <u>99</u> | <u>1</u> |
| | 18.4 | | 74 | | 225 | 35 |

$$Y = 74/18.4 = 4.02 \text{ cm}$$

$$I_{NA} = 225 + 44 = 260 \text{ cm}^4$$

$$W_{el,inner} = 260/4.02 = \underline{\underline{64.7 \text{ cm}^3}}$$

$$W_{el,outer} = 260/(10-4.02) = \underline{\underline{43.5 \text{ cm}^3}}$$

b.

| | | | | |
|------------------|---|--|---|--|
| Total load | = | (30 x 70) + 2000 | = | 4100 kg |
| Force | = | 4100 x 9.81/10 ³ | = | 40.2 kN |
| Eccentricity, e | = | 0.26 + 0.042 | = | 0.30 m |
| Moment | = | 40.2 x 0.30 | = | 12.06 kNm |
| σ | = | $F/A \pm M/W_{el}$ | | |
| σ_{inner} | = | $40.2 \times 10^3 / 18.4 \times 10^2 + 12.06 \times 10^6 / 64.7 \times 10^3$ | = | <u><u>208.2 N/mm² tens.</u></u> |
| σ_{inner} | = | $21.8 + 186.4$ | = | |
| σ_{inner} | = | $40.2 \times 10^3 / 18.4 \times 10^2 - 12.06 \times 10^6 / 43.5 \times 10^3$ | = | <u><u>254.2 N/mm² comp.</u></u> |
| | = | $21.8 - 276.0$ | = | |

E9.3

Elastic moduli:

$$W_{el,top} = 18\,000/10 = 1800\text{ cm}^3$$

$$W_{el,bottom} = 18\,000/15 = 1200\text{ cm}^3$$

Sagging BM:

$$\sigma_{bottom} = 24 \times 10^6 / 1200 \times 10^3 = 20\text{ N/mm}^2\text{ tension}$$

Hogging BM:

$$\sigma_{top} = 9 \times 10^6 / 1800 \times 10^3 = 5\text{ N/mm}^2\text{ tension}$$

∴ Required pre-stress -

$$\text{Stress at N.A. level} = 5 + (15 \times 10/25) = 11\text{ N/mm}^2$$

$$\therefore \text{pre-stressing force} = 11 \times 200 \times 10^2 / 10^3 = \underline{\underline{220\text{ kN}}}$$

$$\begin{aligned} \text{Consider top stresses, } \sigma_{top} &= P/A - Pe/W_{el,top} = 5 \\ 5 &= 11 - 220 \times 10^3 \times e / 1800 \times 10^3 \\ 5 &= 11 - 0.122e \\ e &= \underline{\underline{49.2\text{ mm}}} \end{aligned}$$

$$\begin{aligned} \text{Check bottom stresses, } \sigma_{bottom} &= 11 + 220 \times 10^3 \times 49.2 / 1200 \times 10^3 \\ &= 11 + 9.02 = 20.02\text{ N/mm}^2 - \text{check} \end{aligned}$$

E9.4

$$\begin{aligned}
 I_{NA} &= BD^3/12 - bd^3/12 \\
 &= 3 \times 3^3/12 - 1.8 \times 1.8^3/12 \\
 &= 6.75 - 0.875 \\
 &= 5.875 \text{ m}^4
 \end{aligned}$$

$$\begin{aligned}
 \text{Elastic modulus, } W_{el} &= 5.875/1.5 \\
 &= 3.917 \text{ m}^3
 \end{aligned}$$

$$\begin{aligned}
 \text{Area of section} &= 3^2 - 1.8^2 \\
 &= 5.76 \text{ m}^2
 \end{aligned}$$

$$\begin{aligned}
 \text{Total weight} &= 30 \times 5.76 \times 20 \\
 &= 3456 \text{ kN}
 \end{aligned}$$

$$\begin{aligned}
 \text{Total wind force} &= 30/2 \times 1.3 \times 3.0 \\
 &= 54 \text{ kN}
 \end{aligned}$$

Resultant acts 2/3 of height up chimney:

$$\begin{aligned}
 &= 2/3 \times 30 \\
 &= 20 \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 \text{Overturning moment} &= 54 \times 20 \\
 &= 1080 \text{ kNm}
 \end{aligned}$$

$$\text{Stresses at base} = F/A \pm M/W_{el}$$

$$= 3456/5.76 \pm 1080/3.917$$

$$= 600 \pm 276 \text{ kN/m}^2$$

$$= \underline{\underline{0.876 \text{ N/mm}^2 \text{ Compressive}}}$$

And

$$= \underline{\underline{0.324 \text{ N/mm}^2 \text{ Compression}}}$$

Chapter 10 - Torsion

E10.1

$$\begin{aligned}
 T_{ult} &= 2\tau_y\pi R^3/3 \\
 &= 2 \times 159 \times \pi \times 15^3/3 \\
 &= 1\,124\,000 \text{ Nmm} \\
 &= \underline{\mathbf{1.12 \text{ kNm}}} \\
 \phi &= L\tau/GR \\
 &= (3000 \times 90)/(77\,000 \times 15) \\
 &= 0.234 \text{ rad} \\
 &= \underline{\mathbf{13.4^\circ}}
 \end{aligned}$$

E10.2

a.

| | | | | |
|----------------|---|-----------------------|---|------------------------|
| Area of sign | = | 1.8 x 0.9 | = | 1.62 m ² |
| Design load | = | 1.62 x 1.1 | = | 1.782 kN |
| Bending moment | = | 1.782 x 2.8 | = | <u>4.98 kNm</u> |
| Torque | = | 1.782 x (0.4 + 0.9/2) | = | <u>1.51 kNm</u> |

b.

| | | | | |
|---------------------------------------|---|--------------------------------------|---|----------------------|
| Plastic modulus for bending, W_{pl} | = | $4.98 \times 10^6 / 275 \times 10^3$ | = | 18.1 cm ³ |
|---------------------------------------|---|--------------------------------------|---|----------------------|

Try 60 x 60 x 4.0 square hollow section ($W_{pl} = 18.6 \text{ cm}^3$)

| | | | | | |
|------------------------|-------------------------------|---|---------------------------------|---|---|
| | $\tau_{\text{bending shear}}$ | = | $1782 / (2 \times 60 \times 4)$ | = | 3.7 N/mm ² |
| | A_m | = | 56×56 | = | 3136 mm ² |
| <i>Equation [10.6]</i> | $\tau_{\text{torsion shear}}$ | = | $T / 2A_m t$ | = | $1.51 \times 10^6 / (2 \times 3136 \times 4)$ |
| | | = | 60.2 N/mm ² | | |
| | τ_{total} | = | 3.7 + 60.2 | = | 63.9 N/mm ² < 159 ✓ |

Use 60 x 60 x 4.0 square hollow section

E10.3

a.
Equation [10.7]

$$\tau_{\max} = 3T/at^2$$

Where

$$a = 145 + 70 = 215 \text{ mm}$$

$$\tau_{\max} = \frac{3 \times 1.2 \times 10^6}{(215 \times 10^2)} = \underline{\underline{167 \text{ N/mm}^2}}$$

b.

$$\begin{aligned} \theta &= 3TL/at^3G = \frac{3 \times 1.2 \times 10^6 \times 4000}{215 \times 10^3 \times 77000} \\ &= 0.870 \text{ rad} = \underline{\underline{49.8^\circ}} \end{aligned}$$

Chapter 11 - Connections

E11.1

a.

based on gross area of tie – *equation [6.2]*

$$N_{Rd} = 70 \times 10 \times 275 / 10^3 = 192.5 \text{ kN}$$

based on net area of tie – *equation [6.3]*

$$N_{Rd} = (70-24) \times 10 \times 0.9 \times 410 / (1.1 \times 10^3) = 154.3 \text{ kN}$$

b.

based on shear capacity - *equation [11.3]*

$$F_v = 2 \times 0.6 \times 400 \times \pi \times 11^2 \times 10^{-3} / 1.25 = 146.0 \text{ kN}$$

c.

based on bearing capacity - *equation [11.4]*

$$F_b = 2 \times 400 \times 22 \times 10 \times 10^{-3} / 1.25 = \mathbf{140.8 \text{ kN}}$$

$$\text{Design resistance, } N_{Rd} = \mathbf{\underline{140.8 \text{ kN}}}$$

E11.2

a.

based on gross area of tie – *equation [6.2]*- as above

$$N_{Rd} = 70 \times 10 \times 275 / 10^3 = 192.5 \text{ kN}$$

based on net area of tie – *equation [6.3]*

$$N_{Rd} = (70-22) \times 10 \times 0.9 \times 410 / (1.1 \times 10^3) = 161.0 \text{ kN}$$

b.

based on slip resistance - *equation [11.5]*

$$F_v = 2 \times 0.7 \times 1 \times 0.5 \times 800 \times 245 \times 10^{-3} / 1.25 = \mathbf{109.80 \text{ kN}}$$

c.

based on bearing capacity - *equation [11.4]*

$$F_b = 2 \times 400 \times 20 \times 10 \times 10^{-3} / 1.25 = 128 \text{ kN}$$

$$\text{Design resistance, } N_{Rd} = \mathbf{\underline{109.8 \text{ kN}}}$$

E11.3

| Item | A(cm ²) | y _n (cm) | Ay _n (cm ³) | Y (cm) | Ay ² (cm ⁴) | I _{self} (cm ⁴) |
|-------|---------------------|---------------------|------------------------------------|--------|------------------------------------|--------------------------------------|
| Plate | 60 | 53.8 | 3228 | 17.4 | 18166 | 20 |
| Beam | <u>104</u> | 26.6 | <u>2746</u> | 10.0 | <u>10400</u> | <u>47500</u> |
| | 164 | | 5974 | | 28566 | 47520 |

$$\hat{Y} = 5974/164 = 36.4 \text{ cm}$$

$$I_{NA} = 28566 + 47520 = 76086 \text{ cm}^4$$

Equation [11.9]

$$\text{shear flow/weld, } q = VQ/I = 2500 \times 60 \times 17.4/76086$$

$$= 17.15 \text{ kN/cm}$$

$$= 1.72 \text{ kN/mm}$$

From table 10.1

Use 12 mm fillet weld (strength = 1.87 N/mm)

E11.4

| Item | A(cm ²) | y _n (cm) | Ay _n (cm ³) | Y (cm) | Ay ² (cm ⁴) | I _{self} (cm ⁴) |
|-------|---------------------|---------------------|------------------------------------|--------|------------------------------------|--------------------------------------|
| Plate | 300 | 0.5 | 150 | 8.45 | 21421 | - |
| Beams | <u>205.2</u> | 21.3 | <u>4371</u> | 12.35 | <u>31298</u> | <u>55800</u> |
| | 505.2 | | 4521 | | 52719 | 55800 |

$$\hat{Y} = 4521/505.2 = 8.95 \text{ cm}$$

$$I_{NA} = 52719 + 55800 = 108519 \text{ cm}^4$$

a.

$$W_{pl,top} = 108519/8.95 = 12125 \text{ cm}^3$$

$$W_{pl,bottom} = 108519/(41.6-8.95) = 3324 \text{ cm}^3$$

For critical BM put load at midspan:

$$M_{Rd} = PL/4 = 150 \times 8/4$$

$$= 300 \text{ kNm}$$

$$\sigma_{comp} = 300 \times 10^6 / 12125 \times 10^3 = \underline{\underline{25.0 \text{ N/mm}^2}}$$

Solutions to the end of chapter exercises for *Understanding Structures fifth edition* by Derek Seward

© Derek Seward 2014

$$\sigma_{\text{tens}} = 300 \times 10^6 / 3 \ 324 \times 10^3 = \underline{\underline{90.3 \text{ N/mm}^2}}$$

b.

For critical shear put load adjacent to support:

$$\begin{aligned} V_{\text{Rd}} &= 150 \text{ kN} \\ \text{shear flow, } q &= \frac{VQ}{I} = 150 \times 10^3 \times 300 \times 8.45 / 108 \ 519 \\ &= 3504 \text{ N/cm} \end{aligned}$$

But this is resisted by 6 welds:

$$\text{Shear flow/weld} = 3504 / (6 \times 10) = \underline{\underline{58.4 \text{ N/mm}}}$$

Chapter 12 – Arches and portal frames

E12.1

ΣM about A:

$$(600 \times 8) + (600 \times 16) + (2400 \times 24) = R_E \times 32$$

$$R_E = 2250 \text{ kN}$$

$\Sigma V = 0$:

$$600 + 600 + 2400 = 2250 + R_A$$

$$R_A = 1350 \text{ kN}$$

ΣM about C:

$$(2400 \times 8) + (H_E \times 6) = 2250 \times 16$$

$$H_E = 2800 \text{ kN}$$

$\Sigma H = 0$:

$$H_A = -2800 \text{ kN}$$

a.

$$M_B = (1350 \times 8) - (2800 \times 6)$$

$$= \underline{\underline{-6000 \text{ kNm} - \text{tension in top}}}$$

b.

$$M_D = (2800 \times 6) - (2250 \times 8)$$

$$= \underline{\underline{-1200 \text{ kNm} - \text{tension in bottom}}}$$

$$L_{DE} = 5 \text{ m}$$

For thrust resolve forces parallel to DE:

$$\text{Thrust} = 2250 \times 3/5 + 2800 \times 4/5 = \underline{\underline{3590 \text{ kN}}}$$

For shear resolve forces perpendicular to DE:

$$\text{Shear} = 2250 \times 4/5 - 2800 \times 3/5 = \underline{\underline{120 \text{ kN}}}$$

E12.2

ΣM about A:

$$\begin{aligned} (20 \times 4) + (40 \times 4) + (80 \times 8) + (40 \times 12) &= (R_{BV} \times 12) + (R_{BH} \times 1) \\ 1360 &= 12R_{BV} + R_{BH} \quad \textcircled{1} \end{aligned}$$

ΣM about D:

$$\begin{aligned} (40 \times 4) + (R_{BH} \times 3) &= R_{BV} \times 4 \\ 160 &= 4R_{BV} - 3R_{BH} \quad \textcircled{2} \end{aligned}$$

$$\textcircled{2} \times 3 \quad 480 = 12R_{BV} - 9R_{BH} \quad \textcircled{3}$$

$$\begin{aligned} \textcircled{1} - \textcircled{3} \quad 880 &= 10R_{BH} \\ R_{BH} &= \mathbf{88 \text{ kN}} \end{aligned}$$

$$\begin{aligned} \text{Sub in } \textcircled{1} \quad 1360 &= 12R_{BV} + 88 \\ R_{BV} &= \mathbf{106 \text{ kN}} \end{aligned}$$

$\Sigma V = 0$:

$$\begin{aligned} 40 + 80 + 40 &= 106 + R_{AV} \\ R_{AV} &= \mathbf{54 \text{ kN}} \end{aligned}$$

$\Sigma H = 0$:

$$\begin{aligned} R_{AH} + 20 &= 88 \\ R_{AH} &= \mathbf{68 \text{ kN}} \end{aligned}$$

$$M_C = (63 \times 4) - (68 \times 4) = \mathbf{-56 \text{ kNm}} \text{ (tension in top)}$$

$$M_E = (88 \times 3) = \mathbf{264 \text{ kNm}} \text{ (tension in top)}$$

$$\text{Thrust}_{AC} = 54 \cos 45^\circ + 68 \cos 45^\circ = \mathbf{86.3 \text{ kN}} \text{ (compression)}$$

$$\text{Shear}_{AC} = 54 \cos 45^\circ - 68 \cos 45^\circ = \mathbf{-9.9 \text{ kN}}$$

E12.3

ΣM about A:

$$(2.5 \times 6 \times 3) + (6.5 \times 16 \times 8) + (1.2 \times 6 \times 3) = R_{BV} \times 16$$

$$R_{BV} = 56.2 \text{ kN}$$

M about D:

$$(6.5 \times 8 \times 4) + (R_{BH} \times 7) = (56.2 \times 8) + (1.2 \times 6 \times 4)$$

$$R_{BH} = 38.6 \text{ kN}$$

$\Sigma V = 0$:

$$6.5 \times 16 = 56.2 + R_{AV}$$

$$R_{AV} = 47.8 \text{ kN}$$

$\Sigma H = 0$:

$$(2.5 \times 6) + (1.2 \times 6) + R_{AH} = 38.6$$

$$R_{AH} = 16.4 \text{ kN}$$

E12.4

Using equations 6.1 to 6.3

$$\text{Reactions } R_{AV} = R_{BV} = wL/2 = 40 \times 20/2 = \underline{\underline{400 \text{ kN}}}$$

$$\text{Reactions } R_{AH} = -R_{BH} = wL^2/8D = 40 \times 20^2/(8 \times 4) = \underline{\underline{500 \text{ kN}}}$$

$$\text{Maximum force in arch} = \sqrt{(400^2 + 500^2)} = \underline{\underline{640.3 \text{ kN}}}$$

$$\text{Approximate area required} = 640.3 \times 10^3 / 150 \times 10^2 = 42.7 \text{ cm}^2$$

Try 152 x 152 x 37 Universal Column ($i_z = 3.87 \text{ cm}$, $A = 47.4 \text{ cm}^2$)

$$\text{Non-dimensional slenderness ratio, } \lambda = 2000 / (86 \times 38.7) = 0.60$$

$$\text{From figure 7.38 } \chi = 0.76$$

$$N_{Rd} = 0.76 \times 47.4 \times 275 = 991 \text{ kN} > 640.3$$

Try a smaller size:

Try 152 x 152 x 30 Universal Column ($i_z = 3.82 \text{ cm}$, $A = 38.2 \text{ cm}^2$)

$$\text{Non-dimensional slenderness ratio, } \lambda = 2000 / (86 \times 38.2) = 0.61$$

$$\text{From figure 7.38 } \chi = 0.75$$

$$N_{Rd} = 0.75 \times 38.2 \times 275 = 788 \text{ kN} > 640.3 \checkmark$$

Use 152 x 152 x 30 Universal Column

Chapter 13 – Foundations and retaining walls

E13.1

$$\text{Total unfactored load} = 350 + 275 = 625 \text{ kN}$$

table 13.1 - stiff clay, bearing pressure, $\sigma_{gd} = 200 \text{ kN/m}^2$

$$\text{Area of foundation} = 625/200 = 3.125 \text{ m}^2$$

$$\text{For a square, width} = \sqrt{3.125} = 1.77 \text{ m say } 1.8 \text{ m}$$

$$\text{Projection} = 0.9 - 0.2 = 0.7 \text{ m}$$

From section 13.5.2 Depth, say = 0.75 m

E13.2

For reinforced concrete pad use same plan dimensions as above but only 300 mm deep.

$$\text{Design column load, } N_{Rd} = (1.35 \times 350) + (1.5 \times 275) = 885 \text{ kN}$$

$$\text{Ground pressure, } q = 885/1.8^2 = 273 \text{ kN/m}^2$$

$$\text{Design moment, } M_{Rd} = 0.5 \times 273 \times 1.8 (1.8/2 - 0.4/2)^2 = 120 \text{ kNm}$$

Estimate 12 mm dia. Bars

$$\text{Effective depth, } d = 300 - 40 - 12 - 6 = 242 \text{ mm}$$

$$K = \frac{M}{bd^2 f_{ck}} = \frac{120 \times 10^6}{(1800 \times 242^2 \times 30)} = 0.04$$

From figure 7.47 $z/d = 0.95$

$$z = 0.95 \times 242 = 230 \text{ mm}$$

$$A_s = \frac{M}{f_y z} = \frac{120 \times 10^6}{(500/1.15 \times 230)} = 1200 \text{ mm}^2$$

$$\text{Number of 12 mm bars} = 1200/113 = 11$$

$$1.5(c + 3d) = 1.5(0.4 + 3 \times 0.242) = 1.69 \text{ m} < 1.8 \text{ m}$$

\therefore put 2/3 of bars in middle band

$$\begin{aligned} \text{Width of band} &= C + 3d = 0.4 + (3 \times 0.242) = 1.13 \text{ m} \\ \text{Number of bars in band} &= 2/3 \times 11 = 7 \\ \text{Spacing within band} &= 1130/6 = 188 \text{ mm} \end{aligned}$$

$$\begin{aligned} \text{But spacing if evenly spaced} &= (1800-80)/10 = 172 \text{ mm} \\ &\therefore \text{ Use even spacing} \end{aligned}$$

Shear across pad

$$\begin{aligned} \text{Shear force, } V_{Ed} &= q \times L \times (L/2 - C/2 - d) = 273 \times 1.8 \times (0.9 - 0.2 - 0.242) \\ &= 225 \text{ kN} \end{aligned}$$

$$\text{Shear area} = L \times d = 1800 \times 242 = 435\,600 \text{ mm}^2$$

$$\text{Shear stress, } v_{Ed} = V_{Ed}/(L \times d) = 225 \times 10^3/435\,600 = 0.52 \text{ N/mm}^2$$

$$100 A_s/bd = (100 \times 1200)/(1800 \times 242) = 0.28$$

From table 7.2 $v_{Rd,c} = 0.54 > 0.52$ \therefore no shear reinforcement required.

Punching shear

Check at the face of the column:

$$\begin{aligned} \text{Shear stress, } v_{Ed} &= \frac{q(L^2 - C^2)}{4Cd} = \frac{273(1.8^2 - 0.4^2) \times 10^{-3}}{4 \times 0.4 \times 0.242} \\ &= 2.17 \text{ N/mm}^2 \end{aligned}$$

$$\text{From table 7.3 } v_{Rd,max} = 5.28 \text{ N/mm}^2 > 2.17 \text{ N/mm}^2 \quad \checkmark$$

Check at $a = d$:

$$\begin{aligned} \text{Shear stress, } v_{Ed} &= \frac{q(L^2 - 4Cd - \pi d^2)}{(4C + 2\pi d)d} \\ &= \frac{273(1.8^2 - 4 \times 0.4 \times 0.242 - \pi \times 0.242^2) \times 10^{-3}}{(4 \times 0.4 + 2 \times \pi \times 0.242) \times 0.242} \\ &= 0.961 \text{ N/mm}^2 \end{aligned}$$

$$\begin{aligned} \text{From shear across pad } v_{Rd,c} &= 0.54 \text{ N/mm}^2 \\ v_{Rd} &= 0.54 \times 2d/d \\ &= 1.08 \text{ N/mm}^2 > 0.961 \text{ N/mm}^2 \quad \checkmark \end{aligned}$$

Check at $a = 2d$:

$$\begin{aligned}\text{Shear stress, } v_{Ed} &= \frac{q(L^2 - 8Cd - 4\pi d^2)}{4(C + \pi d)d} \\ &= \frac{273(1.8^2 - 8 \times 0.4 \times 0.242 - 4 \times \pi \times 0.242^2) \times 10^{-3}}{4(0.4 + \pi \times 0.242) \times 0.242} \\ &= 0.413 \text{ N/mm}^2\end{aligned}$$

From above

$$\begin{aligned}v_{Rd,c} &= 0.54 \text{ N/mm}^2 \\ v_{Rd} &= 0.54 \times 2d/2d \\ &= 0.54 \text{ N/mm}^2 > 0.413 \text{ N/mm}^2 \quad \checkmark\end{aligned}$$

Proposed dimensions and reinforcement are satisfactory

E13.3

ΣM about A:

| Item | Weight (kN) | Distance (m) | Moment (kNm) |
|------|------------------------------------|--------------|--------------|
| 1 | $1.0 \times 2.5 \times 24 = 60.0$ | 0.750 | 45.0 |
| 2 | $0.25 \times 0.75 \times 24 = 4.5$ | 0.125 | 0.5 |
| | 64.5 | | 45.5 |

$$\begin{aligned} \text{Distance from A to centre of mass} &= 45.5/64.5 \\ &= 0.705 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{Distance from base centre} &= 0.705 - 0.625 \\ &= 0.080 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{Soil pressure at base} &= K_a \gamma_s z &= 0.33 \times 20 \times 2.5 &= 16.5 \text{ kN/m}^2 \\ \text{Active force} &= 16.5/2 \times 2.5 &= 20.63 \text{ kN} \\ \text{Overturning moment} &= 20.63 \times 2.5/3 &= 17.2 \text{ kNm} \\ \text{Eccentricity, } e_r &= 17.2 - (64.5 \times 0.08)/64.5 &= 0.187 \text{ m} \\ \text{Distance to edge of mid. } 1/3^{\text{rd}} &= 1.25/6 &= 0.208 \text{ m} > 0.187 \text{ m} \end{aligned}$$

i.e. resultant is within middle third

$$\begin{aligned} \sigma_{\max} &= F/A + Fe_r/W_{el} &= 64.5/1.25 + 64.5 \times 0.187 / (1 \times 1.25^2/6) \\ &= 51.6 + 37.1 &= \underline{\underline{88.7 \text{ kN/m}^2}} \end{aligned}$$

Sliding:

$$\begin{aligned} \text{Active force} &= 20.63 \text{ kN} \\ \text{Friction} &= 64.5 \times 0.6 &= 38.7 \text{ kN} \\ \text{Passive resistance force} &= K_p \gamma_s z^2/2 &= 3 \times 20 \times 0.5^2/2 &= 7.5 \text{ kN} \\ \text{Factor of safety} &= (38.7 + 7.5)/20.63 &= \underline{\underline{2.24}} \end{aligned}$$

E13.4

Pressure behind wall becomes:

$$K_a \gamma' z = 0.33 \times (20 - 9.81) \times 2.5 = 3.36 \text{ kN/m}^2$$

$$\gamma_w z = 9.81 \times 2.5 = 24.53 \text{ kN/m}^2$$

$$\text{Total pressure} = 3.36 + 24.53 = 27.89 \text{ kN/m}^2$$

$$\text{Force} = 27.89/2 \times 2.5 = 34.9 \text{ kN}$$

$$\text{Moment} = 34.9 \times 2.5/3 = 29.1 \text{ kNm}$$

$$\begin{aligned} E_r &= 29.1 - (64.5 \times 0.08)/64.5 = 0.37 \text{ m} > 0.208 \text{ m} \\ &\text{i.e. outside middle third} \end{aligned}$$

$$x = d/2 - e_r = 0.625 - 0.37 = 0.255$$

$$\underline{\sigma_{\max}} = 2 \times 64.5 / (3 \times 0.255) = \underline{\mathbf{169 \text{ kN/m}^2}}$$

Sliding:

$$\underline{\text{Factor of safety}} = (38.7 + 7.5) / 34.9 = \underline{\mathbf{1.32}}$$

Chapter 14 – Deflection

E14.1

$$E = 7000$$

| Member | L (mm) | A (mm ²) | F _L (N) | $\delta = \frac{F_L L}{EA}$ (mm) | F _u | F _u δ |

| | | | | | Σ = | 8.04 |

Deflection = 8.04 mm

E14.2

from appendix:

$$I = 18\,600 \text{ cm}^4$$

$$E = 205\,000 \text{ N/mm}^2$$

Use **superposition**:

$$\begin{aligned}
 \text{Deflection, } \delta &= \frac{5wL^4}{384EI} + \frac{PL^3}{48EI} \\
 &= \frac{5 \times 16 \times 7500^4}{384 \times 205000 \times 18600 \times 10^4} + \frac{32 \times 7500^3}{48 \times 205000 \times 18600 \times 10^3} \\
 &= 17.3 + 7.4 \\
 &= \mathbf{24.7 \text{ mm}}
 \end{aligned}$$

E14.3

Aluminium,

$$E = 70\,000 \text{ N/mm}^2 \text{ - table 3.3}$$

2nd mom. Area, I

$$= \frac{\pi R^4}{4} - \frac{\pi r^4}{4} \text{ - figure 7.31}$$

$$= \frac{\pi}{4} (60^4 - 58^4) = 1.29 \times 10^6 \text{ mm}^4$$

$$\delta = \frac{PL^3}{3EI}$$

$$= \frac{150 \times 6000^3}{(3 \times 70\,000 \times 1.29 \times 10^6)}$$

$$= \underline{\underline{120 \text{ mm}}}$$

E14.4

$$\text{Table 3.1} \quad A_s = 3 \times 491 = 1473 \text{ mm}^2$$

$$\text{Effective depth, } d = 500 - 40 - 10 - 12.5 = 437.5 \text{ mm}$$

$$\% \text{ reinforcement} = 100 \times 1473 / (300 \times 437.5) = 1.12\%$$

Table 14.1 by interpolation:

$$\text{Basic span/depth ratio} = 6.76$$

$$\text{Maximum span} = 6.76 \times 437.5 = 2960 \text{ mm say } \underline{\underline{3.0 \text{ m}}}$$

Chapter 15 – Indeterminate structures and computers

E15.1

- a. Each crossed member (2) adds a redundancy plus additional internal roller supports (2) – **answer – 4.**
- b. Simple cantilever is statically determinate so internal roller supports add two redundancies - **answer – 2**
- c. A Three-pin portal is statically determinate so making two pins into rigid joints adds two redundancies - **answer – 2**

E15.2

ΣM about A:

$$\begin{aligned} -267 + (300 \times 2) + 133 - 6R_B &= 0 \\ R_B &= 78 \text{ kN} \end{aligned}$$

$\Sigma V = 0$

$$\begin{aligned} R_A &= 300 - 78 \\ &= 222 \text{ kN} \end{aligned}$$

$$\begin{aligned} M_C &= 267 - (222 \times 2) \\ &= 177 \text{ kNm} \end{aligned}$$

\therefore Design moment, $M_{Ed} = 267 \text{ kNm}$ (i.e. biggest moment on beam)

$$\begin{aligned} W_{pl} &= 267 \times 10^6 / 275 \times 10^3 \quad (\gamma_M = 1.0) \\ &= 971 \text{ cm}^3 \end{aligned}$$

Use 406 x 178 x 54 kg/m universal beam ($W_{pl} = 1050 \text{ cm}^3$)

E15.3

$$\begin{aligned} M_p(2\theta + 3\theta + \theta) &= 300 \times 4\theta \\ 6M_p &= 1200 \\ M_p &= 200 \text{ kNm} \\ W_{pl} &= 200 \times 10^6 / 275 \times 10^3 \quad (\gamma_M = 1.0) \\ &= 727 \text{ cm}^3 \end{aligned}$$

Use 406 x 140 x 39 kg/m universal beam ($W_{pl} = 724 \text{ cm}^3$)

$$\% \text{ reduction} = (54-39)/54 \times 100 = \underline{\underline{27.8\%}}$$
