

# NetScaler Release 10.5 Overview and Features Update

Simeon Bosshard, Systems Engineer  
*Citrix Systems International GmbH*

06.11.2014

# Overview

- NetScaler major release, 2014
- Over 100 features in Beta 1
- New feature highlights
  - NetScaler MobileStream™
  - Core
    - Policy Variables, TCP Optimizations, Traffic Domains, Link Redundancy
  - Load Balancing

# Citrix NetScaler 10

Release 10.5

**NetScaler  
MobileStream™**

**Network  
Virtualization**

**Datacenter  
Enhancements**

# Announcement Highlights

MPTCP	SPDY v3	AAA External Support	SSL Enhancements	OWA Force Session Timeout
Minification	Lazy Image Loading	Mobile Micro VPN	Link redundancy	...
RISE Integration	ACI Integration	SVM M...	...	Client Cert Passthrough
Gateway Enhancements	...	Curve Optimization	Simplified File Operations	LLDP Support
Dynamic Enhancements	Traffic Domains	Domain Sharding	Forms Based SSO Enhancements	Ethernet Jumbo Frames

**Major NetScaler Release  
Over 100 features in Beta!**

# New Licensed Features

Feature	Platinum	Enterprise	Standard
NetScaler MobileStream™	✓	✓	
Policy Variables	✓	✓	✓
Traffic Domains	✓	✓	✓
LLDP	✓	✓	✓
Link Redundancy	✓	✓	✓
Application Firewall	✓	*	
Cisco: RISE*	✓	✓	
Cisco: vPath*	✓	✓	✓

NetScaler MobileStream™	Platinum	Enterprise	Standard
SPDYv3, MPTCP, BIC TCP, CUBIC, TCP Westwood	✓	✓	✓
Domain Sharding, Prefetch, Image Opt, CSS & JS Opt, Lazy loading	✓	✓	
MicroVPN for Mobile Devices (NetScaler Gateway)	✓	✓	✓

\* Note: Only RISE or vPath can be enabled at one time per NetScaler instance

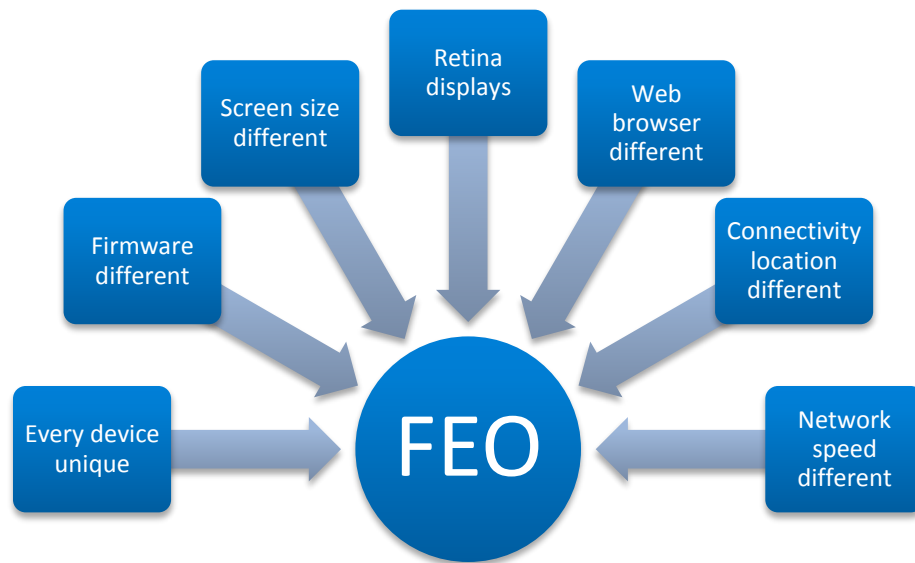

\* Available as an a-la-cart feature

# NetScaler MobileStream™

Front End Optimization (FEO)

# Importance Of Mobile User Acceleration

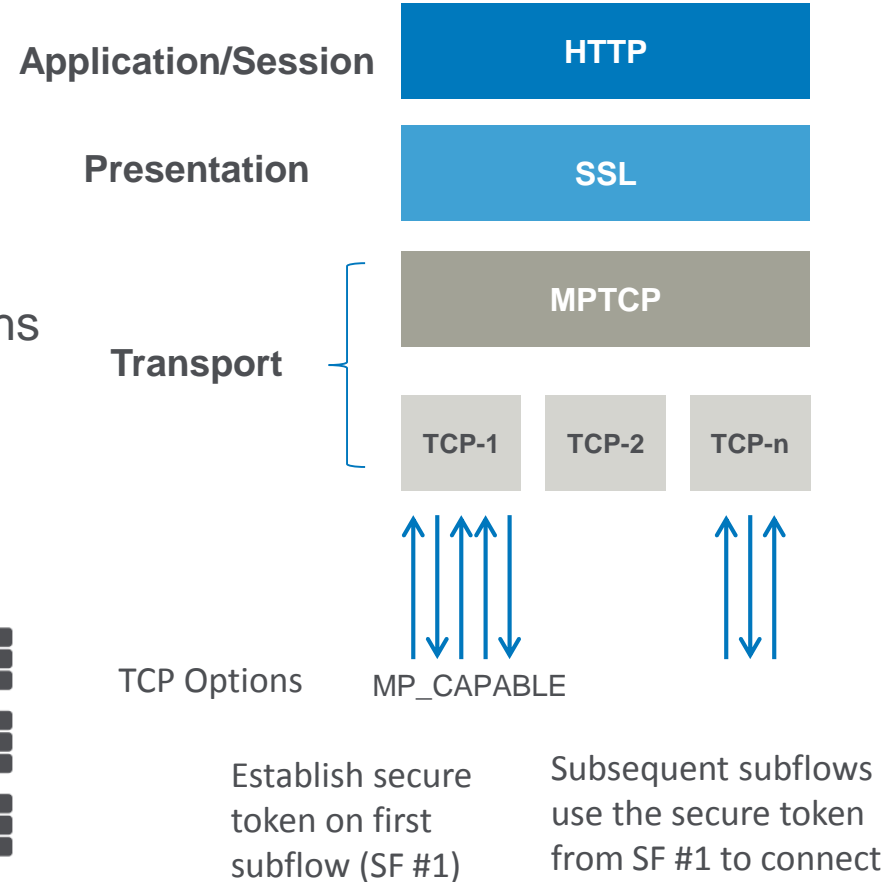

- Optimization historically focused on optimizing and reducing load at the backend.
- With current trend of Mobility NetScaler Focuses on faster and efficient web content delivery by optimizing the web page components most dependent on client side processing.

**Mobile Acceleration Improves Your Mobile Clients' Experience**

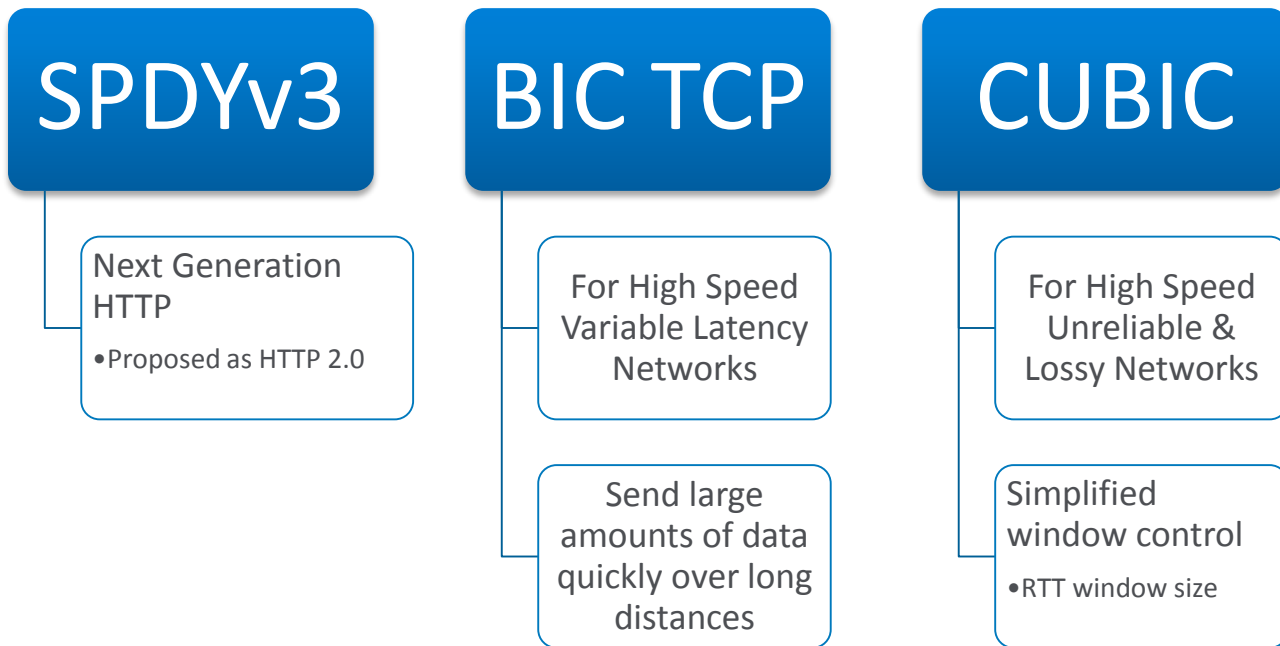

# What is MPTCP?

- Transport layer protocol
- Coexist with TCP
- Provides fault tolerance and path failover
- Increase throughput by using multiple paths
- Availability
  - RFC 6824
  - Linux distribution (Standard & Android)
  - BSD in development

# High-Speed Enablement

# How NetScaler Optimizes The Front-End

## Domain Sharding

- Change embedded URLs to use sub-domains and trick the browser to open more connections

## Minimize & Optimize Order of CSS & JS

- Remove unnecessary characters & space
- Simplify processing & reduce download time to client device
- Move CSS & JS objects to end of HTML body
- Inline Download

## Image Optimization

- JPG optimize, Convert GIF to PNG, Image Lazy load, Image shrink to display attributes of the user-device

**Core**

# Conversion from Java to HTML5

- 1000s of Views now only in HTML5
- Load time reduced by over 50%
- Improved user efficiency
- Following areas will be converted in a 10.5 maintenance release
  - AppFW, Visualizer, Diagnostics

# Core Feature

- Policy Variables

- Store a token (data) from the request or response in a system variable
- Reference stored data for
  - Fully customized session persistence
  - Internal computation
  - Policy processing

# LLDP Support

- Allow stations attached to an IEEE 802 LAN to advertise System Information. Helps to create network topology.
- System information advertised
  - Capabilities
  - Management addresses
  - Connectivity information

LLDP Info consist of multiple TLVs

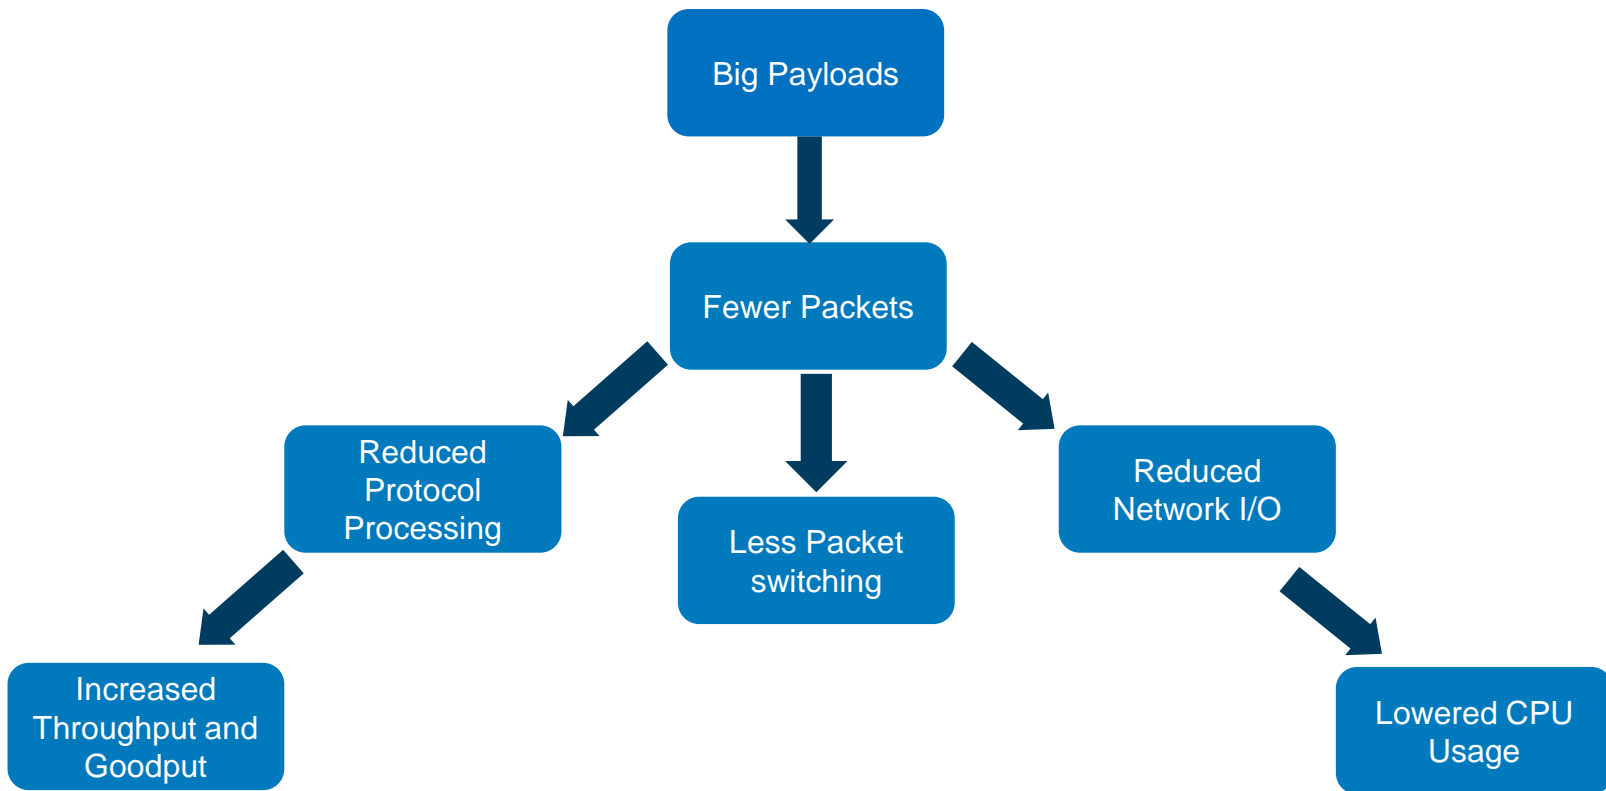

TLVs must be in following sequence

M - mandatory TLV - required for all LLDP

<b>Dst MAC</b> 01-80-C2-00-00-0E	<b>Src MAC</b>	<b>Ether Type</b> 88-CC	<b>LLDP Info</b>
-------------------------------------	----------------	----------------------------	------------------

# Ethernet jumbo frames

# Traffic Domains

- Inter-Domain Routing
  - Internally communicate across traffic domains. Virtual server and services can now be in different traffic domain
- Rate Limiting per traffic domain
  - Limit the ...
    - Number of requests per second from clients
    - Number of Active Client Connections
    - Maximum Bandwidth
- Rates can be
  - SMOOTH - # of requests in a given interval of time spread evenly across the time slice
  - BURSTY - # of permitted requests allowed to exceed the quota within the time slice
- Policies can be combined with others to create complex policy sets
- VMAC Support
  - Map Traffic Domain by destination MAC instead of incoming VLAN
  - VLANs can be shared across traffic domains

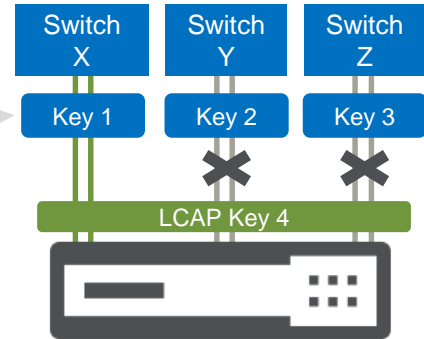

# Link Redundancy

- LR Trigger for LACP channels
  - Set a minimum bandwidth for dynamic channels. When throughput falls below threshold, a link failover is triggered to make another channel.
  - For HA pair, when all channels reach threshold, trigger HA failover.
- LR Trigger for generic channels
  - Fail to another channel (to a redundant switch) when threshold reached

## How it works?

At any point of time only one channel will be active.

One of the active link fails – Min threshold is hit

When one of the active link fails, and lrMinThroughput is hit, we select a subchannel with high throughput and make it active by resetting all other interfaces

# Orchestration

## Python SDK

- NITRO API SDK in Python for better server side scripting. Python SDK will be available and supported with python 2.7 and 3+.

## Dynamic Routing

- NITRO API support for routing protocols. Changes sync to all peers.

## File Operations

- NITRO APIs for Upload, Download, Write and Read methods. Key functional requirements like SSL certkey will be able to get the benefits.

## Other Commands

- NITRO APIs and commands for better system manageability
- Tech Support, batch, source, show nstrace, start nstrace, stop nstrace

# Service Supporting Features

- Content Switching
  - Multi-port CS
    - Configure a CS vserver on a combination of ports
  - DNS\_TCP Support
    - DNS\_TCP protocol is now supported with a Content Switching Vserver
- Audit Logging
  - Ability to distinguish whether the command is executed from CLI or the GUI
- AAA Session Stickiness
  - LDAP, RADIUS, & TACACS: We now stick to the server where last session was successful.

# Service Supporting Features (cont)

- AAA-TM
  - Custom error strings
  - Backend HTTP Web-Form Authentication
  - Strong Encryption Support in KCD/Kerberos (AES-256, RC4-HMAC)
- OWA Force Session Timeout
  - Forced timeout on long-lived connections that are open for monitoring
- Client Certificate Pass-through
  - In XenMobile deployments, a client-certificate is required to be passed to Storefront. Now send the client-certificate any Application server. No configuration needed.
- Forms Based SSO – Relative URLs
  - NS can take relative URL and processed for Form based SSO

# SDX SVM Manageability & 3<sup>rd</sup> Party Software

- CLI Support
- File management via NITRO
- AAA Support
  - Use LDAP/TACACS/RADIUS for SVM access
  - Authorization & Audit log support
  - Password expiration support
  - For more details refer : [AAA edocs](#)
- Ethernet Jumbo Frames Support with SR-IOV
- Central SSL Cert & Key Management

NetScaler SDX

Open service delivery  
platform for  
3<sup>rd</sup> party services

# Load Balancing

# TM & DNS

LB: Increased number of service groups to 8000

DNS LB: CNAME record caching in Proxy mode

- NetScaler to use DNS caching module to cache CNAME record and send it from NS than fetching it every time

DNS: NAPTR

- NAPTR support on NS along with SRV records.

GSLB: Static proximity sync

- Auto sync of static proximity db

# SSL

- **ECC Cipher Support**

- More secure & faster ciphers available on N3-based MPX, SDX, & VPX
  - ECDHE-RSA-RC4-SHA, ECDHE-RSA-DES-CBC3-SHA, ECDHE-RSA-AES128-SHA, ECDHE-RSA-AES256-SHA

- **Common Name Check**

- Server Auth configuration is enhanced to accept “commonName” check. This check will be performed on SSL certificates received from backend server

- **SSL Profiles**

- SSL profiles added for frontend and backend communication

- **SSL Cert Chain**

- Helps identify the certificates belonging to a chain and suggest if a cert is missing in the chain.

# Database Deployment Support

## ✓ MSSQL

- AlwaysOn HA: 1 service can join now 2 groups and be primary in one and secondary in the other
- Special Query Handling: queries can change either global or local properties of the server or connection. “use db” can be changed by NetScaler to reduce server-side connections.

## ✓ MYSQL

- Transparent Deployment Mode: Audit log, AppFlow, & stream analytics transparently for DB connections
- Database-Specific LB: A database can be online or offline independent of others on the same server. New monitor enables DB state awareness.

# Q&A

**CITRIX®**

# What is Admin Partition?

- Logical separation of NetScaler into multiple units
- Functions like an independent Netscaler.
- Provides isolation of configuration and data/traffic
- Provides multi-tenancy, but without separation of system resources, like., CPU, Memory, etc.
- Consists of Application resources (services, vservers, policies, monitors, etc.)

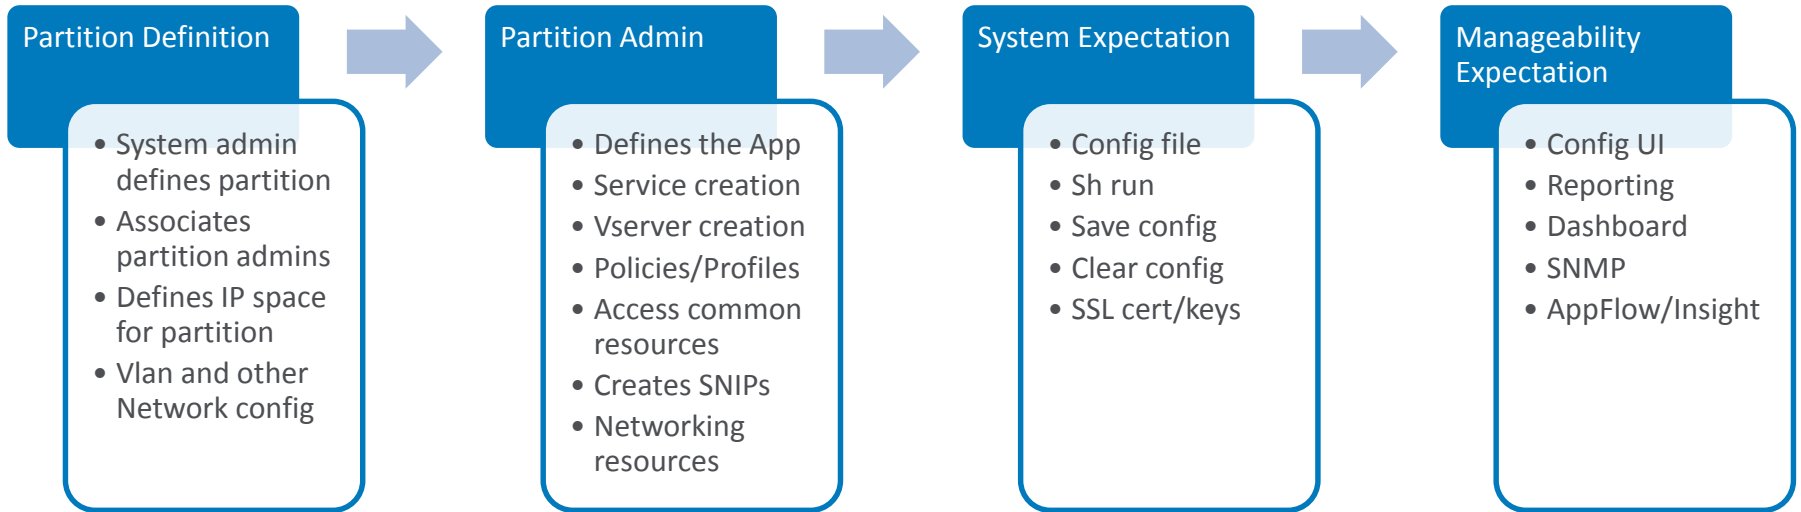

# Highlights of Admin Partition

- Entity space separation
- Data or traffic separation
- Resource management using granular user roles
- Audit/web logging
- Statistics and historical data
- Management through SNMP
- Separate config storage and file system
- Traffic rate limit
- 100s of partitions
- 1 admin – multiple partitions

# Highlights of Admin Partition (Contd...)

- Separate GUI/CLI/Monitoring/Report
- IP overlapping
- External Auth - AAA
- No inter partition routing
- No read/write access to others
- Overall System security
- HA – Connection Mirror

# Admin Partition Workflow
