Who we are:

ORTOGEL S.R.L. has its production center in Caltagirone, in the center of the Sicilian area of excellence for the production of citrus fruits, where, for centuries, the hand of man and the attachment to the land have made citrus cultivation the backbone of agricultural economy.

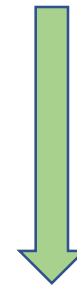

Who we are:

Today, after 40 years of activity in the sector, Ortogel continues to produce 100% N.F.C juices. Fruits are squeezed within 24 hours of harvesting, using highly technological systems that do not alter the flavor and organoleptic properties of the fruits.

The company, due to the need to ensure greater safety in the production chain and higher quality in the product obtained, has chosen to share the production path exclusively with the agricultural sector and local companies, moving away from the processing and distribution sector

24 h

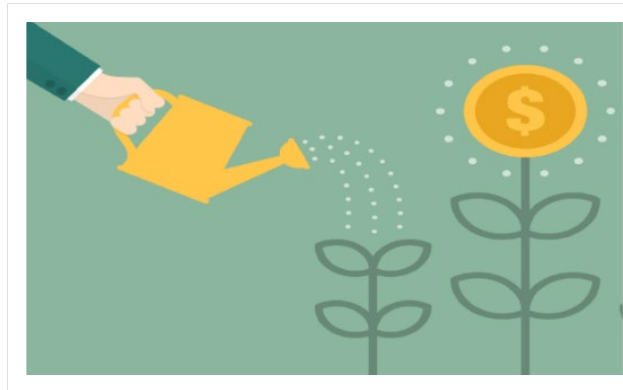

Our Mission

The citrus fruits we process are supplied by companies located in the Calatino area, with which we share a safe and guaranteed supply chain project as established by the UNI ISO 22005: 2008 standards. Our producers deliver their crops to our production site, within 24 hours from time of harvest ensuring the processing and pressing of citrus fruits.

We follow our suppliers during all stages of the production process ensuring the traceability of the product from the tree to packaging.

We have chosen the short supply chain not only to ensure the high quality of the products we pack but above all to support local economies, trade in local products and reduce greenhouse gas emissions coming from the transport of raw materials.

Production model

Our production model is based on the idea of a circular economy in which most of the inputs are generated within our system from waste and with the use of renewable energy.

About 40% of juice and 60% of *pastazzo* are obtained from each orange, i.e. the post-squeezing residue of the fruit consisting of peel and seeds.

For us the *pastazzo* is a precious resource, from it in fact, through innovative systems it is possible to extract noble substances such as polymethoxyphenols and nobilitin, which have healing properties for our body.

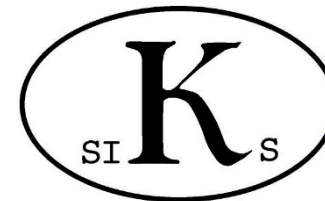

The residual organic substance, on the other hand, is useful for powering the biogas plant, of which we are a partner, which produces biomethane and clean energy that returns to be used at our plant to power the production processes.

In short, no waste is produced from the oranges we squeeze, but on the contrary, from waste materials we are able to obtain water and fertilizers to grow new fruits to be squeezed, biogas for the production activities and noble substances for our body.

Our certifications:

BIOSUISSE
ORGANIC

KOSHER

ORTOGEL SRL has a wide range of products obtained through the transformation of citrus fruits using highly technological systems.

We select the best ripe, healthy and freshly-picked fruits

- ▶ Blood orange from Sicily conventional and organic
