

The fight against financial crime and how to make it matter

Prof Tom Kirchmaier

Centre for Economic Performance, London School of Economics &
Center for Corporate Governance, Copenhagen Business School

24 September 2024

A quick word about myself

- I am an **empirical economist** (loves data)
- Director Policing and Crime at the CEP/LSE
- Co-organiser of the European 'Economics of Crime' Seminar; the annual Chicago-LSE Conference on the Economics of Crime
- Working on the full spectrum of **questions** of Crime and Policing – amongst others on police **productivity**, **OCGs** and **Financial Crime**
- Together with Home Office, RCT on **predicting** areas of high **fraud**, and then hardening households
- Reference model on **crime prediction** in the UK
- Grant by the Swedish Research Council to **study Encrochat / OCG** (with Malmö U)

The issue

- **Large** issue between 1% and 5% of GDP might be problematic. Hence between 1 and 5 trillion dollars are looking to be washed every year (Global GDPe in 2022: \$100 trillion)
- **Market Price** for (large) OCG Money Laundering Services: **6-8%**
- **Expensive** (manual) and cumbersome on the supply side (Banks)
- **Professional organisations** with global networks on the demand side (OCG)
- Very **limited understanding of OCGs**. Enrochat a reminder that we know that we don't know. What we think we know we have seen in Hollywood movies.

Where are we now?

- We **cleaned up the house**, and are AML standards are now on international level
- The Nordea story is a bit of a non-story (as all of it is in the past)
- My argument is that the international **standards are out-dated**, and in urgent need of reform
- There are too many people in this space that **defend the status-quo**, and we don't always attract the best
- Banks in Denmark and the Nordics are solid in general; in DK many small banks that lack a business model
- The **Nordics** are the place to **start the (AML) process revolution**, if it can be brave enough

Institutional Framework

- Born out of G7 in **1989**, and with it the creation of FATF (40 rules)
- Europe immediately falls behind after Nov '89
- The US is further helped by the large defence industrial complex, but the 'poison papers' are now always helpful
- **09/11 brings CFT** (Anti-Money Laundering and Combating the Financing of Terrorism)
- **AMLA** (Authority for Anti-Money Laundering and Countering the Financing of Terrorism) probably the wrong way forward for Europe
- **Europol** might be much better suited
- **Banks as the policeman** you 'don't need to pay for'

The Costs

- **USD 800m - 900m p.a.** for Compliance and AML (up from USD 280m in 2017)
- This is for all banks operating in Denmark and estimated up from the Danske Bank accounts
- There are 2.82m households in Denmark
- That implies **USD 285 - 320 per household**
- Alternatively, there are 6 million inhabitants in Denmark
- That means USD 133 - 150 per person

Regulation – a word of warning

- Observe the push to **argue for over-regulation**, and Brussels is blamed
- Now a **common market** is a market of rules - there is no other way of keeping a market for 450 million people together
- Bureaucracies ratchet up rules, but the way you deal with them is **automation** (not starting a fight against the windmills)
- I agree with Draghi that the issue is that the **common capital market is not working**
- **BREXIT** should be a warning for everyone; Brussels was blamed for all the local problems, but the issues only got (much) worse
- My own paper: Banks in which managers were more insulated from shareholders in 2003 were significantly less likely to be bailed out in 2008/09

Modern systems require regulation

- Air traffic control systems: 96m aircraft movements, 8.7bn passengers in 2023.
- No fatalities on jet airliners, but 72 deaths on board Yeti Airlines ATR 72 in Nepal.

Contrast this with:

- **Boeing 737 Max** (and subsequent issues) - it will probably need a state bailout
- **BP Deepwater Horizon**
- **People trust regulation.** Removing regulation will not instil trust.
- Trust also comes from **running efficient and error free systems** - people observe very quickly the state of affairs

Modern systems require regulation

... and people trust them

- Air traffic control systems: 96m aircraft movements, 8.7bn passengers in 2023
- No fatalities on jet airliners, but 72 deaths on board Yeti Airlines ATR 72 in Nepal

Contrast this with:

- **Boeing 737 Max** (and subsequent issues) - it will probably need a state bailout
- **BP Deepwater Horizon**
- **People trust regulation.** Removing regulation will not instil trust
- Trust also comes from **running efficient and error free systems** - people observe very quickly the state of affairs

Risk management and compliance: a source of profits

- In a competitive market, rents are competed away. How to make profits nevertheless:
 1. Central banks (higher spread)
 2. Scale, scope, and learning (difficult in a small nation)
 3. **Better risk management** (financial and non-financial risk)
- Financial risk: good models, albeit uncorrelated risk becomes correlated under stress
- Non-financial risk: weak to no models. Probably the area with the highest rewards for automation (for you to work on ;)). Taxonomy of risk as the starting point
 - AML is a subset of non-financial risk compliance

Risk management and compliance: a source of profits (II)

- Compliance is a potential **profit center**, and not a cost-center (as it helps to avoid - losses)
- But risk **implies** that we accept losses at times. There needs to be a MC=MB calculation. To pretend and aim at zero loss or suspicious transaction is non-sensical.
- Once we accept that non-financial risk management and compliance (incl. AML) is a profit centre our approach to it is changing:
 - we hire the **best people** into it, and we invest in the future
 - we **stop** approaching it as **box ticking** exercises
 - we start thinking about how to **detect risk cheaper, better, and faster**,
 - hence we **start automating**
- This will also require a change of heart by the regulator, the parliament, and the public at large. For a start we need to **change the sandboxing laws** so that we can **test new models**

On to the Model

A Reminder

Sources of funds, classified as ML

1. Proceeds of (Serious) Criminal Activity
 - Drugs. Human Slavery. Child Sexual Exploitation. Racketeering. Fraud. Cyber & Organised Crime. Environmental crime.
 - Real impact on society, and asset prices (property & businesses)
 - Organised crime and jihadi groups increasingly intertwined
2. Embezzlement of State Funds, Tax Evasion, and Serious Corruption
3. Avoidance of Currency Controls (China)
4. [Terror Finance]

A Reminder

Sources of funds, classified as ML

1. Proceeds of (Serious) Criminal Activity
 - Drugs. Human Slavery. Child Sexual Exploitation. Racketeering. Fraud. Cyber & Organised Crime
 - *Primary and secondary effect*: real impact on society, and asset prices
 - Organised crime and jihadi groups at one point intertwined
2. Embezzlement of State Funds, Tax Evasion, and Serious Corruption
3. Avoidance of Currency Controls (China)
4. [Terror Finance]

Each 'customer group' /
demand category
requires its own
detection model

A Reminder

Sources of funds, classified as ML

1. Proceeds of (Serious) Criminal Activity
 - Drugs. Human Slavery. Child Sexual Exploitation. Racketeering. Fraud. Cyber & Organised Crime. Environmental crime.
 - Real impact on society, and asset prices (property & businesses)
 - Organised crime and jihadi groups increasingly intertwined
2. Embezzlement of State Funds, Tax Evasion, and Serious Corruption
3. Avoidance of Currency Controls (China)
4. [Terror Finance]

How to think about a model

Demand = Supply

How to think about a model

Demand (OCGs) = Supply (Banks)

How to think about a model

~~Demand~~ (OCGs) = Supply (Banks)

The police services (or equiv.) currently don't share data with the banks in an automated way.

How could a solution look like?

- We are currently looking for a LHS to estimate our model, hence:
 1. We need to find a model that enable data sharing across banks, institutions (Supervisors/FIUs, Police, ...), and jurisdictions, or ...
 2. We need to bootstrap it out ourselves from conviction (courts) data

Solution II

We estimate:

Bottom-up models

Solution

The solution is to use **small spaces** as the **unit of analysis**

- People select into homogenous groups, which we can exploit
- This allows us to strip out personal identifiers without using much information that is relevant to us

'People Based' Approach

Census Output Areas (OA)

- 181,408 OAs (ONS 2011) in E&W
- Each is a socially homogeneous parcel of 125 households (median)
- Census, wealth, and non-residential infrastructure (POI) as explanatory variables (bottom-up)
- 18 forces, 50 million data points for 2009 – 2015/6
- Four variables (Time, Place, Grade, Closing Code)
- Using Machine Learning techniques (Lasso) to narrow down coefficients of crimes / incidents

The data that is available to us

1. The physical infrastructure (points of interest)
2. Socio-economic profile (census)
3. Affluence...deprivation (house prices)

In short

We estimate the underlying features of the space, and not the person (or firm)

This will give us a generalisable model which we can then roll out across countrie(s)

Maps

- Public, but not publicised. PW: 16692

[Home](#) [Research](#) [Interests](#) [Links & Data](#) [Use Cases](#) [Brexit Impact](#) [Corporations](#)

Links & Data

HMIC/HO/LSE Maps (27 December 2016)

Average annual observed demand data for 17 forces in E&W:

- [Crimes](#) (all)
- [Incidents](#) (grade 1&2 - incl. crimes)

This allows us to predict demand by type across all police forces. These maps are supplied across forces.

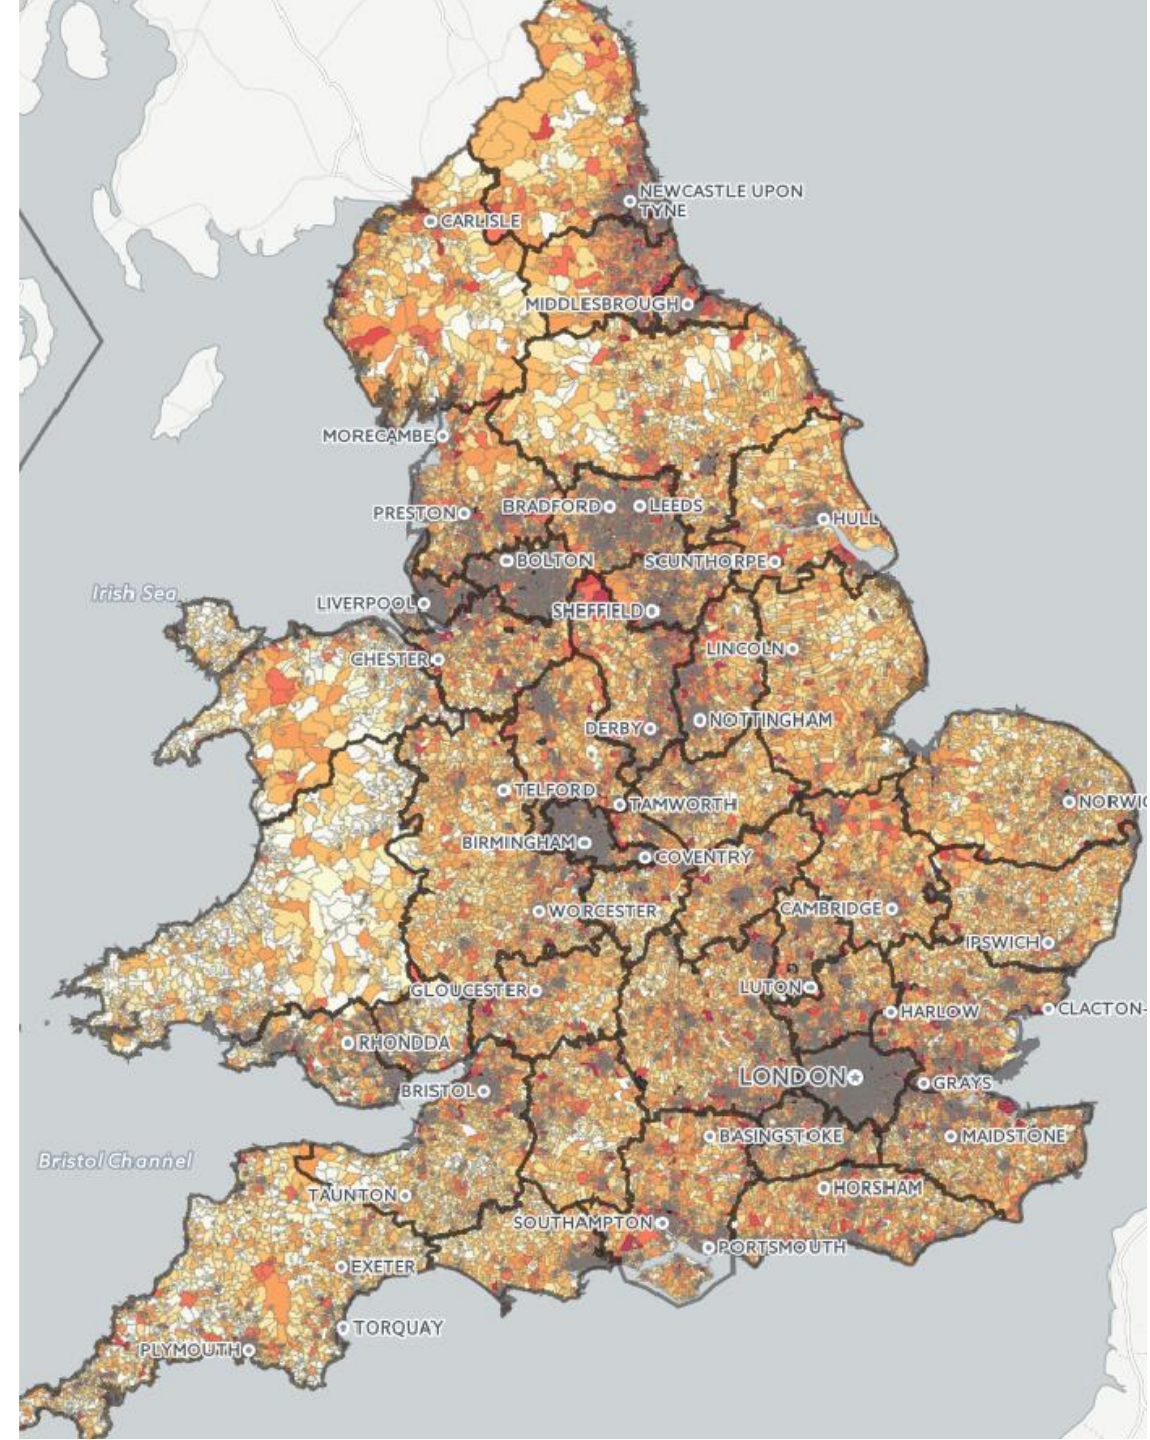

- [Predicted Crimes](#) (all)
- [Predicted Incidents](#) (grade 1&2 - incl. crimes)

And a number of more specialised maps (password protected):

- [Predicted Violence against the Person](#) (VAP)
- [Predicted Sexual Offences](#) (SOF)
- [Predicted Robbery](#) (ROB)
- [Predicted Drug Offences](#) (DOF)
- [Predicted Possession of Weapon Offences](#) (WOF)
- [Predicted Public Order Offences](#) (POF)
- [Predicted Theft Offences](#) (TOF)
- [Predicted Criminal Damage and Arson Offences](#) (CDAO)
- [RTC](#) (serious + grade 1&2)
- [Predicted Low volume - High Costs](#) (OLH)
- [Predicted Property Crime](#) (PPC)
- [Predicted Violence plus SO](#) (VIO)
- [Predicted Miscellaneous Crimes Against Society](#) (MCA)
- [Predicted Missing Person](#) (MIP)

Other Maps

- [OA and Police Force centroids](#) and boundaries
- [Social Deprivation in England](#) (2011)
- [Population Density in England and Wales](#) (2011)
- [Commercial Density in England and Wales](#) (2015)

Enabling data sharing
Developing rich prediction models

A short recap

There are now two ways to approach that

Aggregating by small (pre-defined) spaces allows us to:

- Have a very **rich picture about the identity of people (and firms)** that locate in certain areas, and associate them with certain (problematic) behaviour
- Given that we estimate the model based on public data, we can transpose the learnings across countries with equally good data (western world)
- Even in the absence of any useable data (some dev. countries) we can still use the space to create frequencies

A short recap

There are now two ways to approach that

We now have a system that is:

- Global
- Universal
- Additive
- Open
- Fast and cheap

Application for the various bank data streams

SARs

- Step one is to run a prediction model on SARs, and see if banks is actually catching all those it should?!
- We enhance the SARs data with public data like Sanctions
- We also look at the counter-parties across Europe and the world
- In an ideal world we will then incorporate SARs from other banks/SOIK too, and start to do the same across Europe

OCGs

- In the next step we will start to add 'demand' data
- We are currently working on a prediction model for firearms and drugs (UK) and OCGs more generally (Sweden)
- This will be the first time crime demand data is applied to AML, ideally in the payment stream
- This will then be enhanced / extended to the other (S)OC crime types

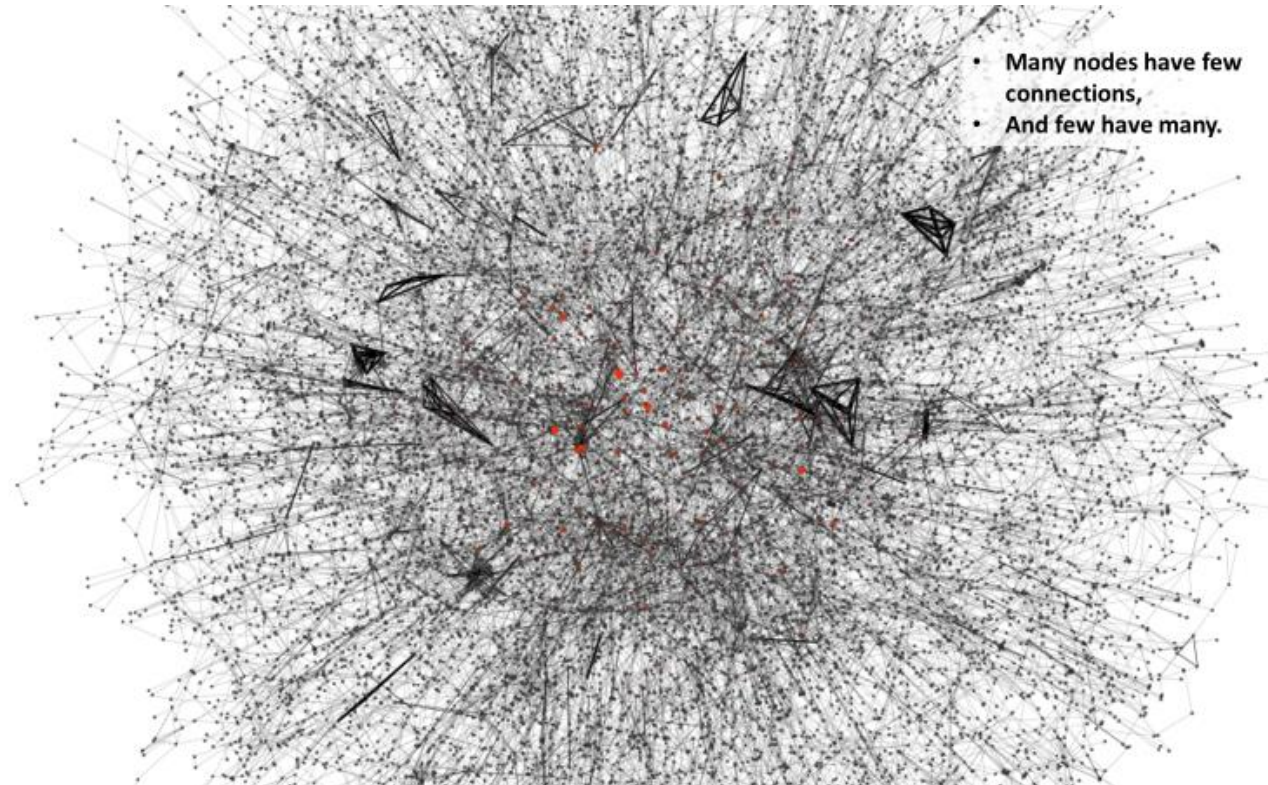

Counter-parties

Sanity check of corporate
counter-parties using a vector of
controls / sense checks

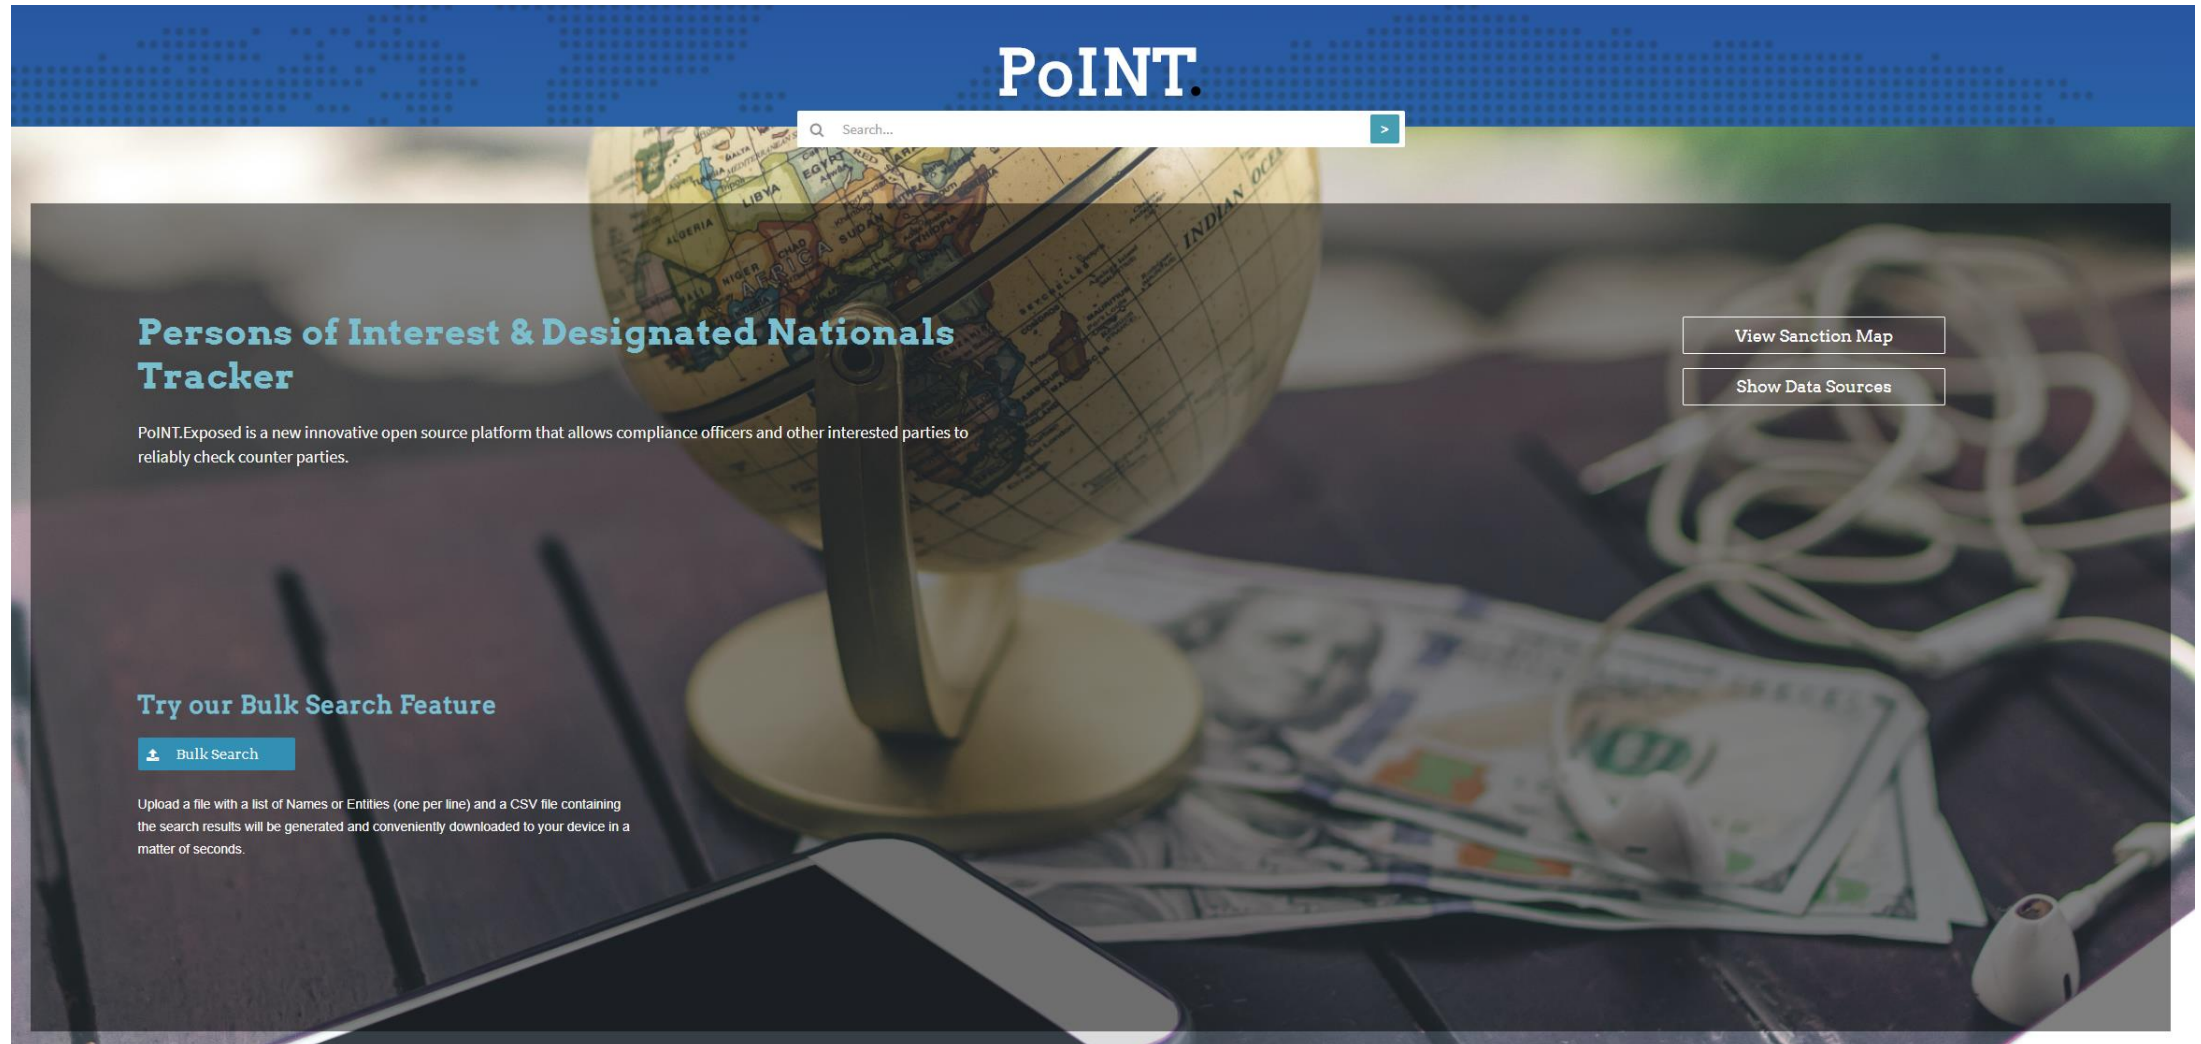

opencorporates....

Network Patterns

- We will then start to look at a location-enhanced network analysis.

<https://point.exposed>

The image shows the homepage of the PoINT. Exposed website. The background is a blurred photograph of a desk with a globe, some papers, and a smartphone. The website has a blue header with the 'PoINT.' logo in white. Below the header is a search bar with a magnifying glass icon and a green arrow button. The main content area is divided into two sections. The top section is titled 'Persons of Interest & Designated Nationals Tracker' in bold teal text. Below the title is a paragraph: 'PoINT.Exposed is a new innovative open source platform that allows compliance officers and other interested parties to reliably check counter parties.' To the right of this text are two buttons: 'View Sanction Map' and 'Show Data Sources'. The bottom section is titled 'Try our Bulk Search Feature' in bold teal text. Below the title is a button with a plus icon and the text 'Bulk Search'. Underneath the button is a paragraph: 'Upload a file with a list of Names or Entities (one per line) and a CSV file containing the search results will be generated and conveniently downloaded to your device in a matter of seconds.'
