# SMART CITY SERVER

The parking garage of the future

The parking garage of the future is a hub and control center for data-driven business models, we call it a Smart City Server.

New, data-centric business models only work when there is a clear separation of data generator, data owner and data user.

Office Space
Parking
Energy manager
Logistic hub
Mobility provider
Storage

- The data generator produces the data and can, e.g., a vehicle, a human being, a sensor or a machine
- The data owner has control over the data - the simplest example of an owner is an individual
- The data user could, e.g., be the provider of value added services

PARKING
LOGISTICS
MOBILITY PROVIDER
ENERGY MANAGER

Smart City Server

The following applications are Smart City Server compatible:

easyoffice
