© 2026 The School for Field Studies

COURSE CONTENT SUBJECT TO CHANGE

Please note that this is a copy of a recent syllabus. A final syllabus will be provided to students on the first day of academic programming.

SFS programs are different from other travel or study abroad programs. Each iteration of a program is unique and often cannot be implemented exactly as planned for a variety of reasons. There are factors which, although monitored closely, are beyond our control. For example:

- Changes in access to or expiration or change in terms of permits to the highly regulated and sensitive environments in which we work;
- Changes in social/political conditions or tenuous weather situations/natural disasters may require changes to sites or plans, often with little notice;
- Some aspects of programs depend on the current faculty team as well as the goodwill and generosity of individuals, communities, and institutions which lend support.

Please be advised that these or other variables may require changes before or during the program. Part of the SFS experience is adapting to changing conditions and overcoming the obstacles that they may present. In other words, this is a field program, and the field can change.

Course Overview

This component of the program focuses on identifying threats to wildlife populations, how to obtain data on the impact of these threats on wildlife populations and how to select and apply appropriate conservation methods to mitigate these threats. We will look at these aspects in general and then demonstrate them in case studies in the Wet Tropics.

To formulate a background understanding of habitats of the Wet Tropic's wildlife, we will explore the origin of the main landscape formations of this part of Australia by looking at geological and biogeographical factors that shaped the landscape and its biota. You will be introduced to Australia's fauna and the unique species that inhabit the diverse habitats of the Wet Tropics. We then will deal with some basic ecological concepts of biodiversity and why so many species can co-exist in one place. This will also involve learning skills to obtain data on various parameters of wildlife populations to assess the impact of habitat loss, fragmentation, introduced species and climate change on them. Field trips and field work in various parts of the Atherton Tablelands will help you learn these skills.

Using the obtained data on wildlife populations we will explore various conservation techniques to mitigate these threats to the flora and fauna of the Wet Tropics, how to identify partners and resources for conservation work, how to triage conservation needs, and how to best advocate conservation. We will consider the role of corridors or landscape linkages, particularly along riparian areas, and ways in which restoration and landscape rehabilitation can overcome negative effects of human driven landscape modification and climate change on these ecosystems. We will consider options on how to efficiently control pest animals and their impact on native flora and fauna.

The course is a mixture of class lectures, field lectures, field laboratory courses, workshops, field trips, and readings to complement the material presented in the lectures. A major emphasis is on field skills, the collection, management and analyses of data, and skills of writing a scientific paper. A wide range of material will be provided and should be used to study the class topics and to acquire the desired skills. Be aware that all material covered in class, lectures, field lectures, field trips and readings is examinable.

The Wildlife and Conservation Biology Course is divided into four parts. In the first part, you will become familiar with the basics of wildlife ecology which will help you to understand the threats to fauna (Part 2). In part 3 you will be introduced to various field techniques when collecting data on animals which leads us to part 4 in which we discuss ways to mitigate threats to fauna populations. You will be involved in various current conservation projects on the Atherton Tablelands in which CRS participates. These projects will assist you in understanding the principles of effective wildlife conservation. The course will also give you an understanding on how to effectively communicate and advocate for conservation.

Learning Objectives

Following this course, students should understand:

1. the factors that influenced the origin of the Wet Tropics' landscapes and ecosystems
2. the ecology of rainforest, freshwater, and marine ecosystems of the Wet Tropics
3. the fauna of the Wet Tropics
4. the threats to wildlife populations of various ecosystems in the Wet Tropics
5. the issues associated with conserving wildlife populations and managing rainforest, freshwater, and marine ecosystems in the Wet Tropics

Assessment

Assessment Item	Value (%)
Fauna Quiz	15
Pecha Kucha presentation	15
GIS Revegetation Database Assignment	20
FEX Report	20
Final Exam	20
Participation	5
TOTAL	100

Fauna Quiz (15%)

The purpose of this quiz is to develop your skills in identifying birds of our rainforest by sound and visual cues. As the Atherton Tablelands is home to a diverse fauna the familiarization with the most common species will help us to better understand the roles these animals play in the ecosystems of this region. We will conduct bird walks to practice techniques to quickly identify birds by sight and/or sound. The quiz will give you some familiarity with the Wet Tropics fauna.

PechaKucha Presentation and video (15%)

You will be assigned an animal of the Wet Tropics. Together with one of your fellow students, you will tell a story about this animal in form of a PechaKucha presentation. The presentation should provide information on the taxonomy of the species, its main habitat, its social structure, how it could be captured and how the main threats of the Wet Tropics affect your species. The presentation should finish with a short video (less than 1 minute) that shows the behavior of your species, followed by a brief interpretation of the behavior.

GIS Revegetation Database Assignment (20%)

During the course you will apply your acquired knowledge in collecting spatial data in the field, displaying spatial data using GIS software, retrieving further spatial data using provided maps and storing your spatial information in a GIS database. Many factors contribute to the success of a revegetation site and its colonization by wildlife. CRS-SFS has started in 2016 to compile a database that collates planting and site-specific information that can help to identify factors which contribute the most to a site's development, to derive site-specific management practices, to select best practices of revegetation on the Tablelands and to study the colonization of revegetated sites by wildlife. In this group assignment you will be assigned a restoration area from which you collect spatial data in the field, retrieve further spatial data and add these data to CRS-SFS's Revegetation database.

FEX Report (20%)

During our Field Exercise we will assess the diversity of mammals in old growth rainforests and secondary forests at CRS using non-invasive methods. We will apply some of the wildlife field techniques which you became familiar with. You will design data sheets, collect data and develop your own research question. Workshops on scientific writing and statistical data analysis will prepare you to write your mock scientific paper.

Final Exam (20%)

During the final exam you will be tested on material presented in lectures, field lectures, and excursions. Answering questions will require critical and analytical thinking across the various teaching units.

Participation (5%)

During the course, students will be graded by faculty based on their overall participation in fieldwork and during lectures or discussion. Students may also have their peers involved in giving feedback on how each of them participated during group work.

Grading Scheme

A	95.00 - 100.00%	B+	86.00 - 89.99%	C+	76.00 - 79.99%	D	60.00 - 69.99%
A-	90.00 - 94.99%	B	83.00 - 85.99%	C	73.00 - 75.99%	F	0.00 - 59.99%
		B-	80.00 - 82.99%	C-	70.00 - 72.99%		

General Reminders

Honor Code/Plagiarism – SFS places high expectations on their students and we hold students accountable for their behaviors. SFS students are held to the honor code below. SFS has a zero-tolerance policy towards student cheating, plagiarism, data falsification, and any other form of dishonest academic and/or research practice or behavior. Using the ideas or material of others without giving due credit is cheating and will not be tolerated. Any SFS student found to have engaged in or facilitated academic and/or research dishonesty will receive no credit (0%) for that activity.

I approach coursework, fieldwork, and research with integrity and commit to full participation. I do my own work with honesty and give credit where it's due. I use tools and technology responsibly and only as permitted. I speak up when something conflicts with our shared values. I respect the communities we learn from and commit to ethical, non-extractive research that keeps knowledge connected to the places and people who share it with us.

Deadlines – Deadlines for written and oral assignments are instated to promote equity among students and to allow faculty ample time to review and return assignments before others are due. As such, deadlines are firm; extensions will only be considered under extreme circumstances. Late assignments will incur a penalty of 10% of your grade for each day you are late. After two days past the deadline, assignments will no longer be accepted. Assignments will be handed back to students after a one-week grading period. Grade corrections for any assessment item should be requested in writing at least 24 hours after assignments are returned. No corrections will be considered afterwards.

Content Statement – Every student comes to SFS with unique life experiences, which contribute to the way various information is processed. Some of the content in this course may be intellectually or emotionally challenging but has been intentionally selected to achieve certain learning goals and/or showcase the complexity of many modern issues. If you anticipate a challenge engaging with a certain topic or find that you are struggling with certain discussions, we encourage you to talk about it with faculty, friends, family, the HWM, or access available mental health resources.

Participation – Since we offer a program that is likely more intensive than you might be used to at your home institution, missing even one lecture can have a proportionally greater effect on your final grade simply because there is little room to make up for lost time. Participation in all components of the course is mandatory, it is important that you are prompt for all activities, bring the necessary equipment for field exercises and class activities, and simply get involved.

*Not all readings will be required.

No	Topics Covered	Hours	Type	Required Readings
Part 1: Basics of Wildlife Ecology and Threats to the Wet Tropics Fauna				
1	Course Overview This lecture introduces you to the course content, course components and resources. This lecture will get you into the swing of discovering Australia's unique wildlife, the threats to it and attempts to conserve it.	1.0	L	Geyle, et al. (2018). Ward and Williams (2021). Ritchie (2022). Lau (2025). Ward, et al. (2025). Woinarski, et al. (2025).
2	Introduction to History of Human Colonization of the Wet Tropics, Implications on Wildlife and Current Mitigation Strategies A video will introduce you to the factors that were leading up to the declaration of the Wet Tropics World Heritage Area and how the community of the Atherton Tablelands engages in wildlife conservation.	1.0	L	Onus (2022). Moran, et al. (2017). Goosem and Tucker (2013). Winter, et al. (1987).
3	Geological Processes That Shaped the Landscapes and Fauna of the Tablelands and the Great Barrier Reef Let's dive into the past and see how geological events created the various landscape elements we are seeing today along the coast of North Queensland, and how they have affected the fauna of this area.	1.5	L	Whitehead, et al. (2007). Johnson and Prideaux (2004). Johnson (2004). Stephensons (1989). Winter (1997). Black, et al. (2012).
4	The Atherton Tablelands: Geology, Land Use, Threats and CRS's Conservation Projects We will explore some of the geological features of the Atherton Tablelands and how they affected the land use. We will see how land uses affect the distribution of native vegetation and which consequences this has	4.0	FL	Stephensons (1989). Haberle (2005). Latch (2008). Laurance (2008). Schwartz, et al. (2020). Fahrig (2017). Wintle, et al. (2019).

	for wildlife. You will also visit places where CRS's conservation projects are happening.			Heise-Pavlov and Gillanders (2016). Villard and Metzger (2014). Woinarski, et al. (2015). Eldridge and Koen (2008). Dickman, et al. (2019). Doody, et al. (2021). Williams, et al. (2003). Wagner, et al. (2020). Meade, et al. (2018). Mella, et al. (2019).
5	Debrief of Atherton Tour	0.5	L	
6	Vertebrates of Rainforests and Freshwater Ecosystems of the Wet Tropics We will talk about the lives of some faunal elements of the rainforest and water streams around you. Keep your eyes open and always explore the fauna. Contact your faculty for assistance in identifying your observations.	1.0	L	Ramsey (2005). Pearson, et al. (2015). Pepper, et al. (2018). Pettit, et al. (2016). Heise-Pavlov, et al. (2011). Freeman and Freeman (2009). Heise (2017).
7	Invertebrates of Rainforests and Freshwater Ecosystems of the Wet Tropics We will talk about the taxonomy of some invertebrates of the rainforest and water streams around you. In a brief workshop you will be introduced to the tools for identifying ants and dung beetles.	4.0	L; WS	Yeates and Monteith (2008). Connolly, et al. (2008). Pearson, et al. (2015).
8	Fauna of the Great Barrier Reef In this guest lecture you will get familiarized with the many different creatures that inhabit the ecosystems of the Great Barrier Reef.	1.0	L	Ceccarelli, et al. (2014). Cheal, et al. (2012). Jones, et al. (2018). Hof, et al. (2017). Emslie, et al. (2017). Kingsford, et al. (2012). Sobtzick, et al. (2017).
9	Biodiversity and Life in the Jungle We will explore the different meanings/types of biodiversity and some ecological terms related to biodiversity. We will analyze the different roles animals play in an ecosystem and mechanisms that ensure that species can all co-exist.	1.0	L	Attiwill and Wilson (2006). Alamgir, et al. (2018). Graham, et al. (2010). Kiley, et al. (2019). Kitching, et al. (2007). Sekercioglu (2006). Gordon, et al. (2010). Tingley, et al. (2014). Zavaleta, et al. (2009).

No	Topics Covered	Hours	Type	Required Readings
10	The Cairns Aquarium You will visit the Aquarium in Cairns and explore the marine wonder world without getting wet.	2.5	EXC	
Part 2: Wildlife and Conservation Field Techniques				
11	Conservation Field Techniques During community service you will be introduced to restoration practices and will assist in CRS-driven and community-driven restoration projects.	3.0	CP	
12	Field Technique 1: Species Identification You will be introduced to species ID methods in the field and lab, and by using apps.	3.0	WFT	
13	Field Technique 2: Animal Observations You will be given a brief introduction to the study and description of animal behavior and will apply some of these techniques.	1.0	WFT	Smith and Pinter-Wollman (2021).
14	Field Technique 3: Nocturnal Fauna Methods We will go out to explore the nocturnal fauna of a rainforest habitat. You will become familiar with the technique of spotlighting.	2.5	WFT	Lindenmayer, et al. (2001). Underwood, et al. (2022).
16	Stories on Animals of the Wet Tropics In a PechaKucha style presentation you will tell us a story about an animal that was assigned to you including information on the taxonomy of the species, its main habitat, its social structure, how it could be captured and how the main threats of the Wet Tropics affect your species. The presentation should finish with a short video and the interpretation of the behavior seen.	2.0	AS	
17	Wildlife Field Technique 4: Introduction to Spatial Tools in Wildlife Conservation This workshop consists of two parts. Part A: In this part we will learn how to extract spatial information from topographic maps and how to collect spatial data in the field. Part B: In this part we will practice how to manage spatial data that we collected in the field, and we will familiarize ourselves with the various parts of ARC-GIS software.	5.0	WS	Kozak, et al. (2008). Heise-Pavlov and Gillanders (2016). O'Kane, et al. (2014).

No	Topics Covered	Hours	Type	Required Readings
Part 3: Your Contribution to CRS's Conservation Projects				
18	GIS Revegetation Database Assignment You will collect spatial data from a revegetation plot assigned to your group. Using GIS software, you will extract further spatial information of this plot and add this information to CRS's Revegetation database.	4.0	AS	Heise-Pavlov and Tng (2023). Deher, et al. (2017). Framework for Ecosystem Recovery (2024).
19	Field Exercise You will develop, prepare, implement, and report on a small research project. You will be introduced to rules of scientific writing and methods for statistical data analysis during the FEX. You will develop your own specific research question and write a mock scientific paper to address your question.	3.5	FEX	
Part 4: Mitigating Threats to Fauna Populations				
20	Mitigating Threats to Wildlife A tour on the Tablelands will show you the main ways to mitigate impacts of humans on wildlife of this area. This field lecture will cover the following parts (20A, 20B, 20C) which will be debriefed in a collated lecture form.	4.0	FL	
20A	Mitigating Habitat Loss and Fragmentation You will be introduced to various ways to restore lost habitat. You will hear about colonization of restored habitat by essential fauna and how this colonization can be facilitated.		Debrief	Soule, et al. (2004). Elgar, et al. (2014). Florentine (2008). Lindenmayer (2019). Pascual-Hortal and Saura (2006). Cattarino, et al. (2016). Soanes, et al. (2018). Jones, et al. (2011). Goosem, et al. (2005). Villard-Metzger (2014). Zeller, et al. (2012). 	impact on native Australian wildlife populations. You will also hear about some modern techniques that genetics and animal behaviour research are now providing to wildlife ecologists.			Van Bommel and Johnson (2017). Nelson, et al. (2011). Humphrys and Lapidge (2008). Massei and Cowan (2014).
20C	Mitigating the Effects of Climate Change on Wet Tropics Animal Populations Apart from reducing our greenhouse gas emissions to prevent further global warming, there are a number of measures we can implement to reduce the impact of global warming on wildlife populations, particularly in the high elevated areas of the Atherton Tablelands which contain many endemic species that depend on cooler climates.		Debrief	Weber, et al. (2021). Seymour (2020). Moomaw, et al. (2021). Reside, et al. (2014). Keppel, et al. (2015). Reside, et al. (2017).
21	Assessment of Animal Population Extinction Risk For a realistic assessment of the impact of threats to wildlife populations we need an understanding of population parameters such as birth rates, fecundity, growth rates, reproductive parameters, mortality rates and how they affect the resilience of populations to threats.	1.0	L	Akçakaya and Sjögren-Gulve (2000). Chaudhary and Oli (2020). Brodie, et al. (2018). Franklin, et al. (2021). Godwin, et al. (2020). Fragan and Holmes (2006).
22	Assessing Effects of Conservation Actions How can we assess whether our conservation work was successful? Shortage of resources for conservation demands effective methods that work, but how to assess their outcomes?	1.0	L	Mahlum, et al. (2018). Schori, et al. (2020). Lindenmayer, et al. (2013).
23	Learning from a New Guinea Species Conservation Case In a video you will be taken on a journey by two Australian conservationists who worked with indigenous people to protect tree-kangaroos in remote areas of New Guinea.	1.0	L	
24	Exam Review	1.0	REV	
	Total	51.5		
	UMN Instructional Hours*	61.8		

**UMN defines an instructional hour as a 50-minute block. SFS syllabi are written in full 60-minute hours for programming purposes. Therefore 50 full hours = 60 UMN instructional hours (for four credit courses) and 25 full hours = 30 UMN instructional hours (for two credit courses).*
