Black Swans & Bayesian Networks

Stefan Conrady | stefan.conrady@bayesia.us | +1 888-386-8383 Webinar on July 19, 2019

"Black Swan"

According to Taleb:

"What we call here a Black Swan (and capitalize it) is an event with the following three attributes.

First, it is an outlier, as it lies outside the realm of regular expectations, because nothing in the past can convincingly point to its possibility.

Second, it carries an extreme 'impact'.

Third, in spite of its outlier status, human nature makes us concoct explanations for its occurrence after the fact, making it explainable and predictable."

"Black Swan"

DECIMVS IVNIVS IVVENALIS SATVRA VI

'Nullane de tantis gregibus tibi digna videtur?' sit formosa decens dives fecunda, vetustos porticibus disponat avos, intactior omni crinibus effusis bellum dirimente Sabina, rara avis in terris nigroque simillima cycno: quis feret uxorem cui constant omnia? malo, malo Venusinam quam te, Cornelia, mater Gracchorum, si cum magnis virtutibus adfers grande supercilium et numeras in dote triumphos, tolle tuum, precor, Hannibalem victumque Syphacem in castris et cum tota Carthagine migra.

"Do you say no worthy wife is to be found among all these crowds?" Well, let her be handsome, charming, rich and fertile; let her have ancient ancestors ranged about her halls; let her be more chaste than the disheveled Sabine maidens who stopped the war—*a prodigy as rare upon the earth as a black* swan! yet who could endure a wife that possessed all perfections? I would rather have a Venusian wench for my wife than you, O Cornelia, mother of the Gracchi, if, with all your virtues, you bring me a haughty brow, and reckon up Triumphs as part of your marriage portion. Away with your Hannibal, I beseech you! Away with Syphax overpowered in his camp! Take yourself off, Carthage and all!

Translated by G. G. Ramsay

Today's Agenda

General Research Question

- How to manage risks related to never-seenbefore events?
- How to represent common and rare events jointly?

Specific Research Question

 How to find the optimal composition of a "pureplay" portfolio of maritime stocks, considering common and extreme events?

Today's Agenda (cont'd)

Analysis & Optimization Workflow with BayesiaLab

- Collect historical data from maritime shipping companies.
- Machine-learn Bayesian network to approximate the joint probability distribution of the underlying data.
- Select stocks and optimize portfolio given historical volatility.
- Hypothesize about potential risks and elicit assessments.

- Augment learned network with expert judgments.
- Optimize portfolio given common and hypothetical extreme events.

BAYESIALAB

A desktop software for:

- encoding
- learning
- editing
- performing inference
- analyzing
- simulating
- optimizing
- with Bayesian networks.

Slides, networks, and video will be available

PORTFOLIO SELECTION*

HARRY MARKOWITZ The Rand Corporation

THE PROCESS OF SELECTING a portfolio may be divided into two stages. The first stage starts with observation and experience and ends with beliefs about the future performances of available securities. The second stage starts with the relevant beliefs about future performances and ends with the choice of portfolio. This paper is concerned with the second stage. We first consider the rule that the investor does (or should) maximize discounted expected, or anticipated, returns. This rule is reThis presumption, that the law of large numbers applies to a portfolio of securities, cannot be accepted. The returns from securities are too intercorrelated. Diversification cannot eliminate all variance.

The portfolio with maximum expected return is not necessarily the one with minimum variance. There is a rate at which the investor can gain expected return by taking on variance, or reduce variance by giving up expected return.

We saw that the expected returns or anticipated returns rule is inadequate. Let us now consider the expected returns—variance of returns (E-V) rule. It will be necessary to first present a few elementary concepts and results of mathematical statistics. We will then show some implications of the E-V rule. After this we will discuss its plausi-

Modern Portfolio Theory

What is Modern Portfolio Theory?

- Modern Portfolio Theory (MPT) is a theory on how investors can construct portfolios to maximize expected return based on a given level of market risk.
- According to the theory, it's possible to construct an "efficient frontier" of optimal portfolios offering the maximum possible expected return for a given level of risk.

BayesiaLab.com

Risk and Return

- Expected Return:
 - $E(R_P) = w_A E(R_A) + w_B E(R_B)$
- Expected Return Variance:

•
$$\sigma_P^2 = w_A^2 \sigma_A^2 + w_B^2 \sigma_B^2 + 2w_A w_B \sigma_A \sigma_B \rho_{AB}$$

- Gaussian assumptions of return distributions in MPT may not hold.
- Variance is a symmetric measure, but risk is not symmetric, i.e., only "downside" is risk; "upside" is opportunity.
- MPT provides a statistical, not a structural model.

- Gaussian assumptions of return distributions in MPT may not hold.
- Variance is a symmetric measure, but risk is not symmetric, i.e., only "downside" is risk; "upside" is opportunity.
- MPT provides a statistical, not a structural model.

Countermeasures

- Gaussian assumptions of return distributions in MPT may not hold.
- Variance is a symmetric measure, but risk is not symmetric, i.e., only "downside" is risk; "upside" is opportunity.
- MPT provides a statistical, not a structural model.

Hypothetical Event

NAVY BLOCKADE OF MALACCA STRAIT

Hypothetical Event

NUCLEAR SUBMARINE DISASTER IN MALACCA STRAIT

Impact on Stock Market

Black Swan Scenarios

- Any such risks are obviously not reflected in the Bayesian network that we used to • optimize our investment portfolio.
- So, how can we account for such risks?

BayesiaLab.com
Modern Portfolio Theory

- Gaussian assumptions of return distributions in MPT may not hold.
- Variance is a symmetric measure, but risk is not symmetric, i.e., only "downside" is risk; "upside" is opportunity.
- MPT provides a statistical, not a structural model.

Countermeasures

Black Swan Scenarios

Potential Impact on Stock Portfolio

 We need to modify the joint probability distribution so that it reflects our estimates of the extreme event.
