Bayesian networks make it possible to identify relevant drivers for Health System and establish priorities.

With this approach, public health researchers can quickly, generate clear recommendations for decision makers: Ministry of Health and funding organizations.

International context

Sustainable Development Goals

3.8 Achieve universal health coverage, including financial risk protection, access to quality essential health-care services and access to safe, effective, quality and affordable essential medicines and vaccines for all

3.8.1 Coverage of essential health services (defined as the average coverage of essential services based on tracer interventions that include reproductive, maternal, newborn and child health, infectious diseases, non-communicable diseases and service capacity and access, among the general and the most disadvantaged population)

3.8.2 Proportion of population with large household expenditures on health as a share of total household expenditure or income

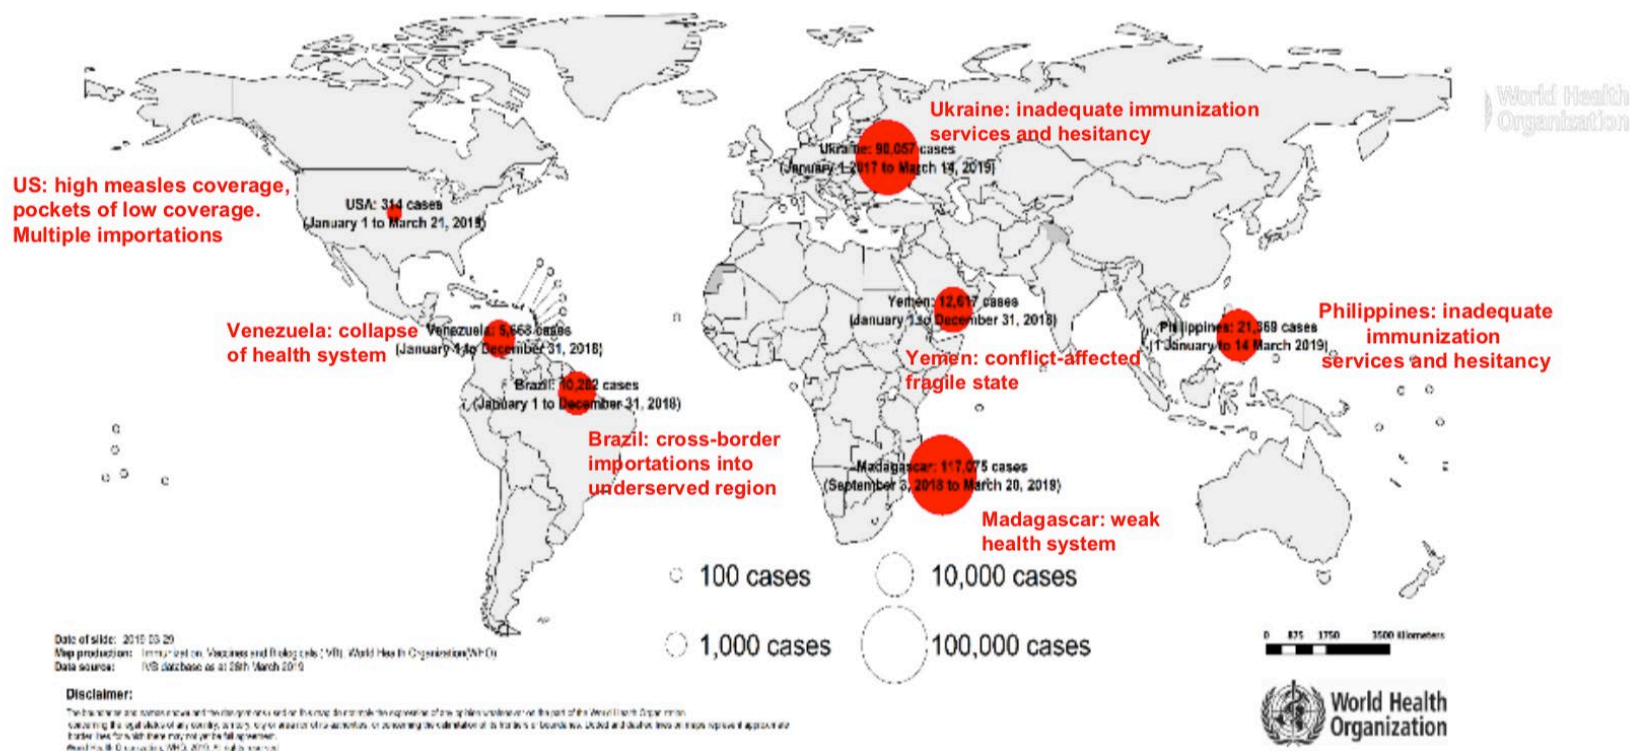

300% increase in measles cases worldwide

Measles outbreaks in all regions with increased size and frequency

Same root cause: failure to vaccinate over many years

Challenge

Complex and intertwined drivers of Expanded Programme on Immunization (EPI) performances

Solution

Theory of change + Bayesian Networks as Modeling Framework

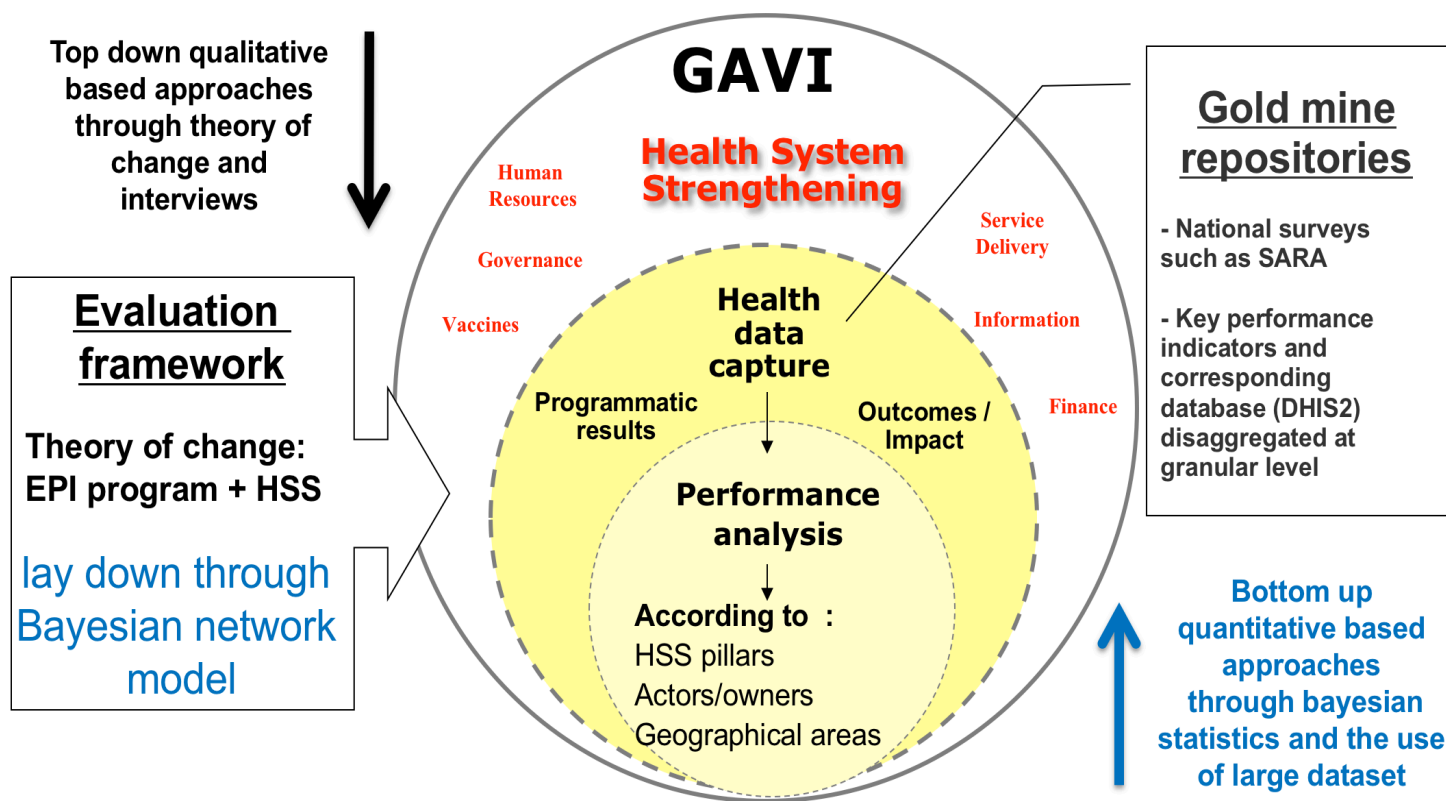

Overall approach

GAVI : The Vaccine Alliance

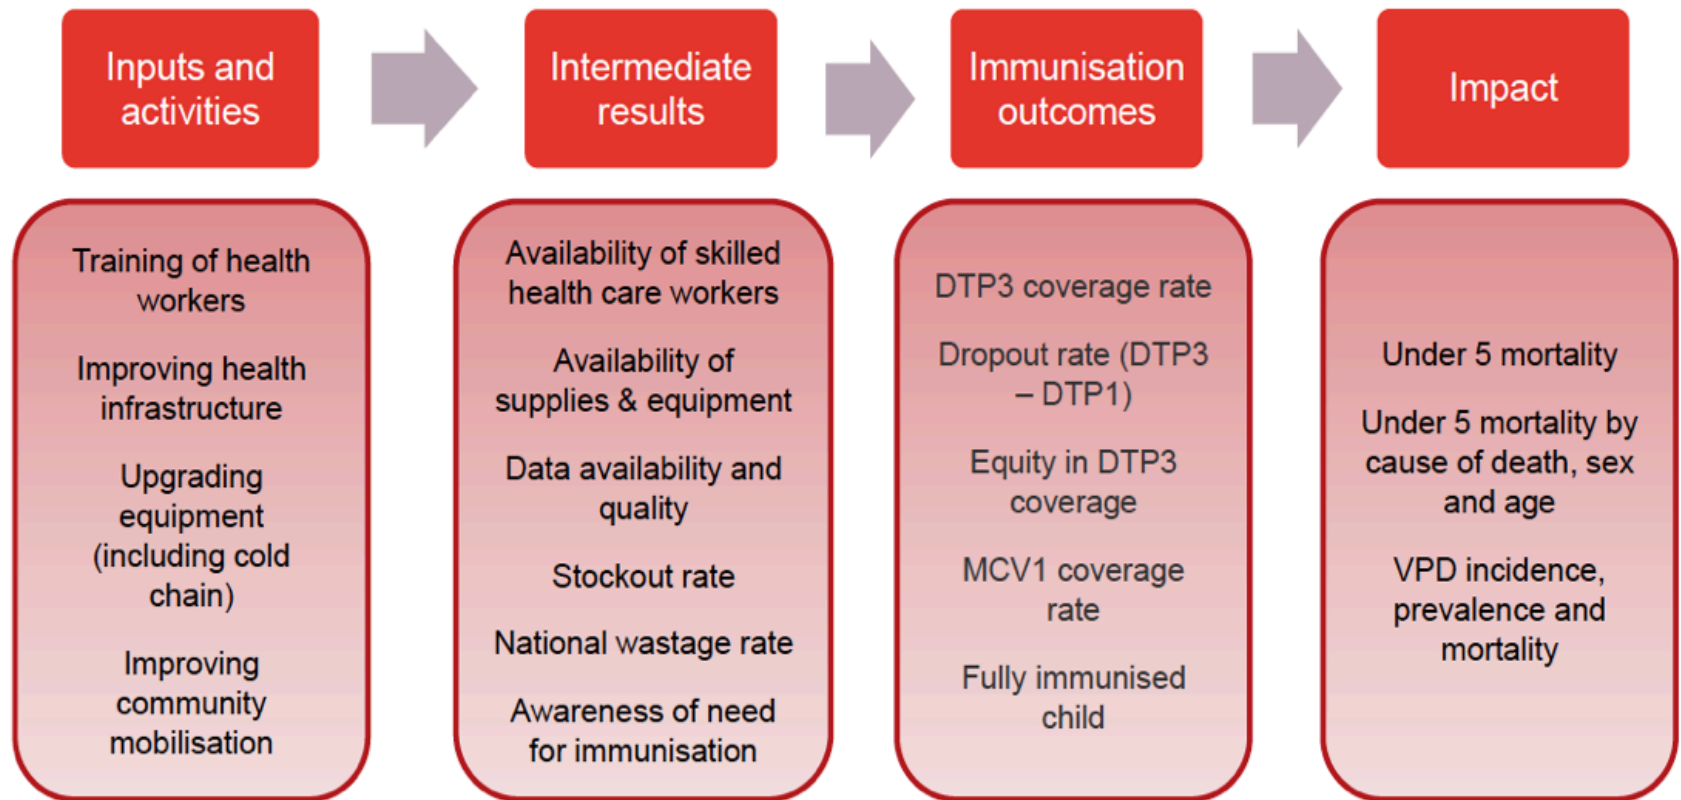

Assessing the current situation and needs of Health System Support & Strengthening for improving EPI program performances

through innovative analytical technique based upon modeling and data mining

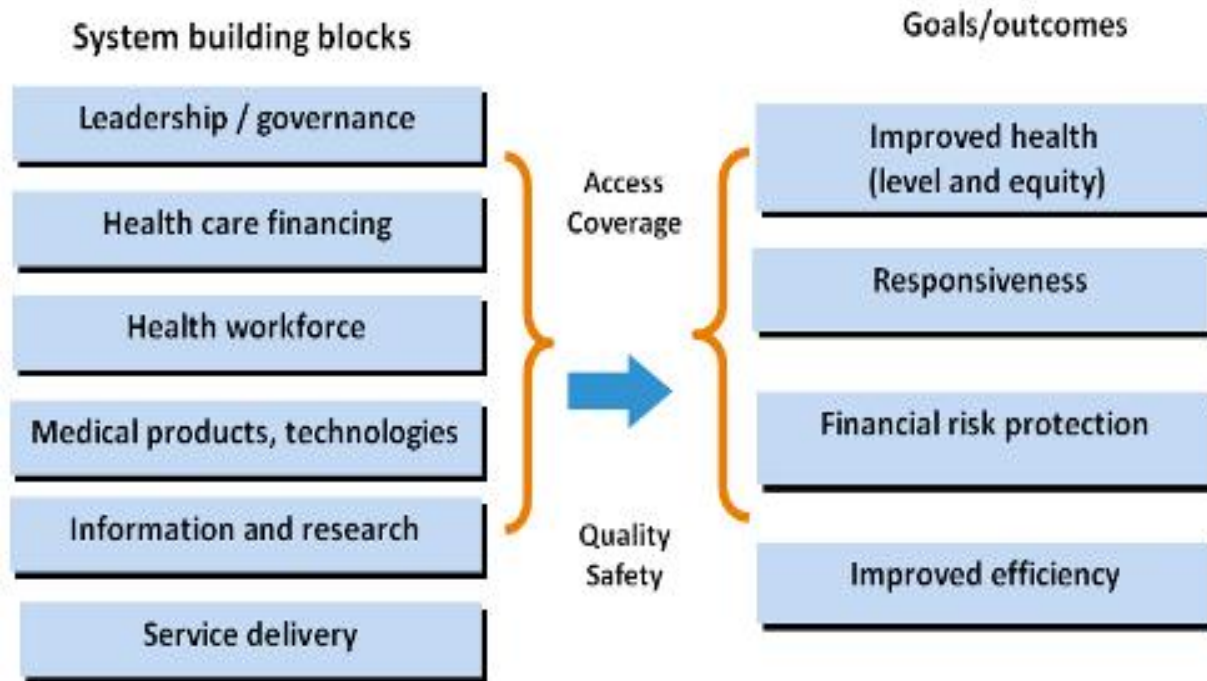

HSS Theory of change

Expert knowledge: causal linkages established

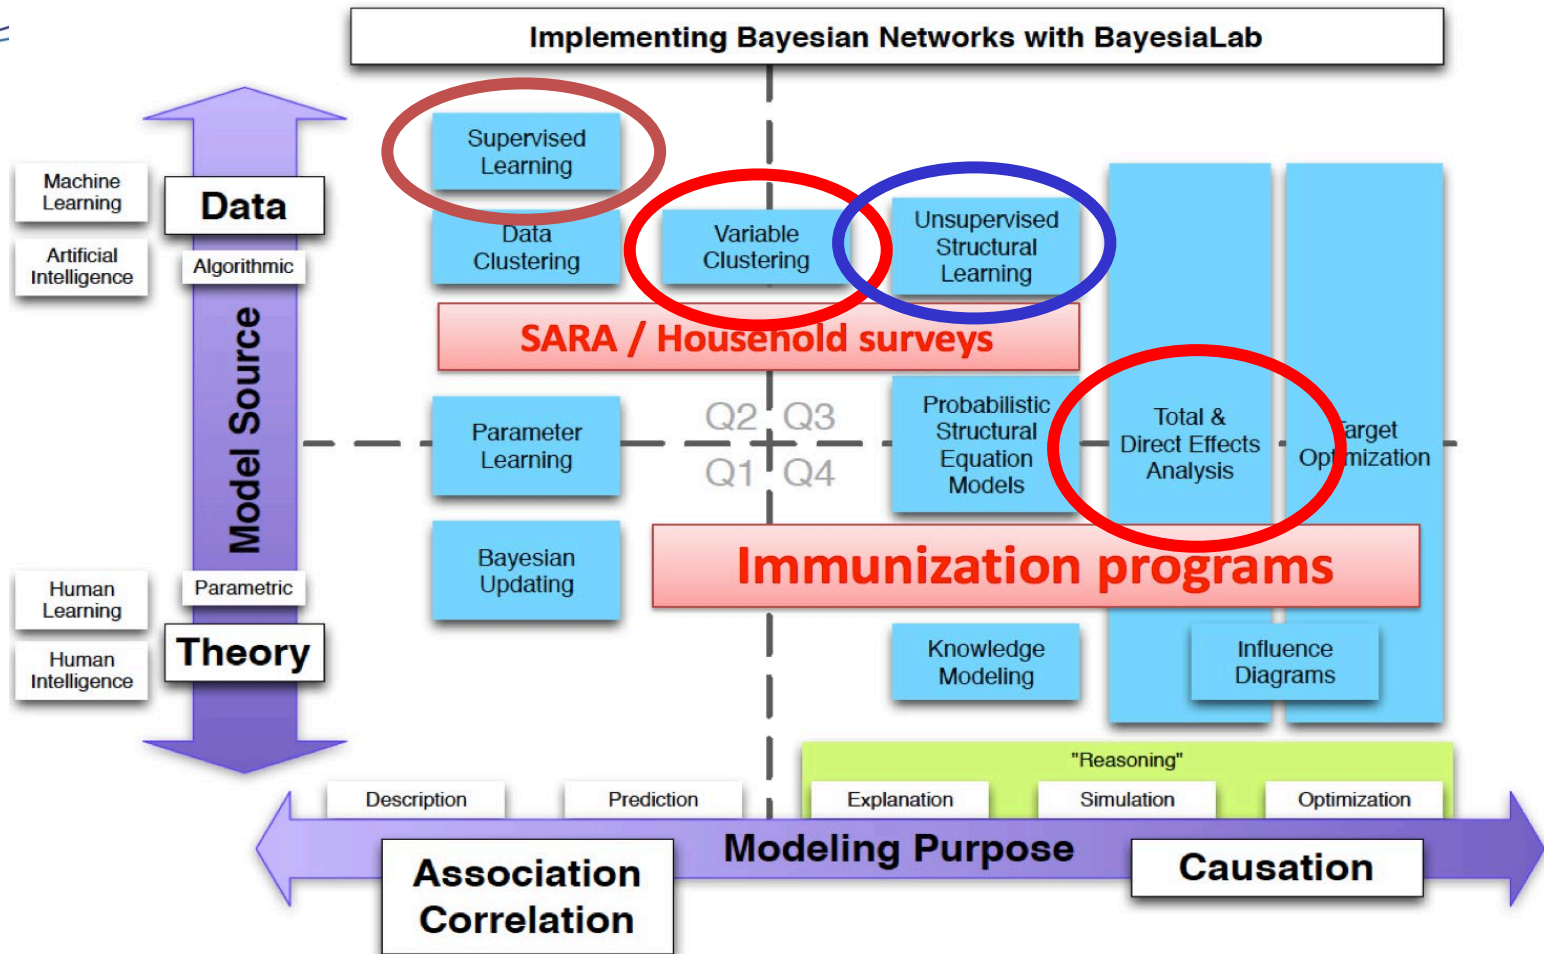

WHO Health Systems Framework

Aware of areas of strength and vulnerability

Ability to adapt structurally, functionally and socially

Bayesian Networks: Towards causation

Unsupervised learning to discover all the direct probabilistic relations
 Variable clustering to induce “factors” made of highly connected variables
 Supervised learning to characterize the targeted variables

Data source

The SARA survey is designed to generate a set of core indicators on key inputs and outputs of the health system + Health Information System

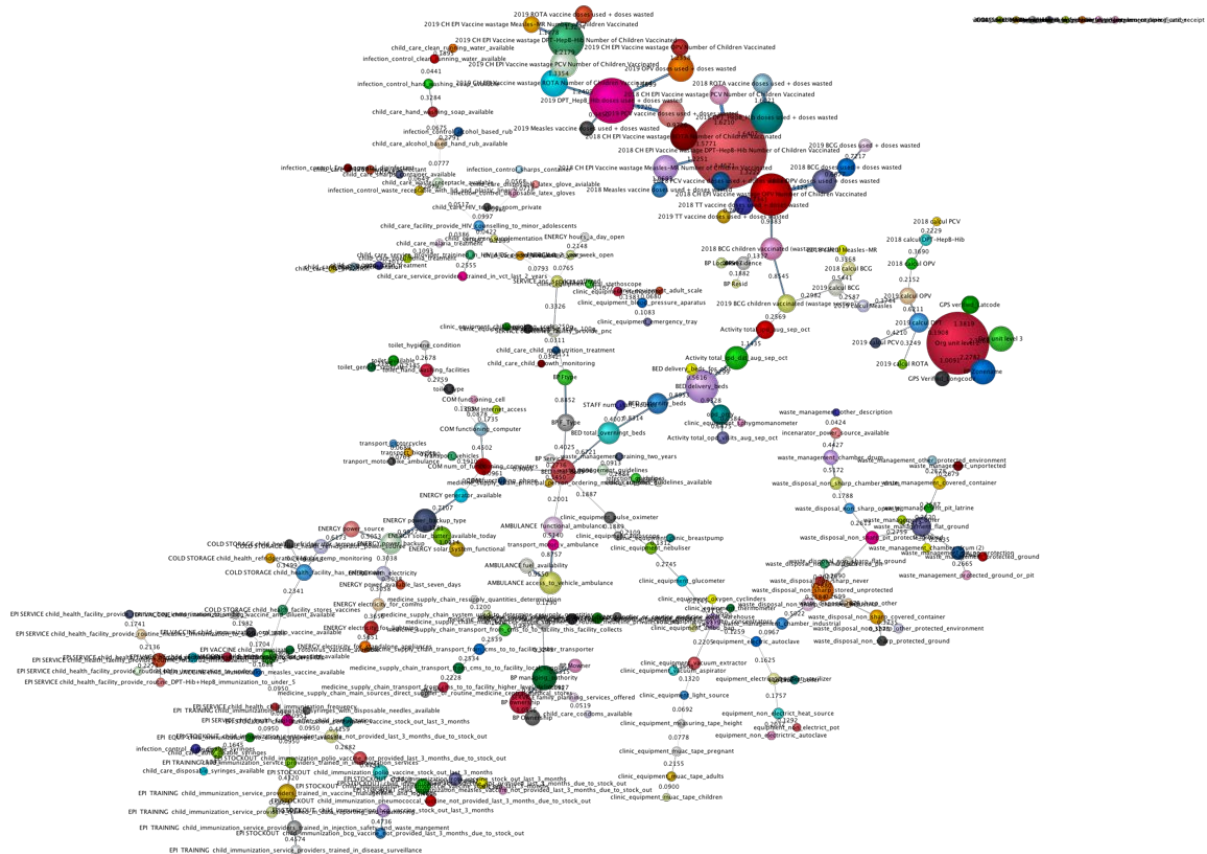

Data selection

Group of columns or surveyed questions which refer specifically to the Immunization program and corresponding building blocks

Original SARA dataset : 480 columns and 1,242 rows → 245/...

Node Analysis (size): Node Force – Arc Analysis: Mutual Information

Data selection / broad categories

Unsupervised Structural Learning

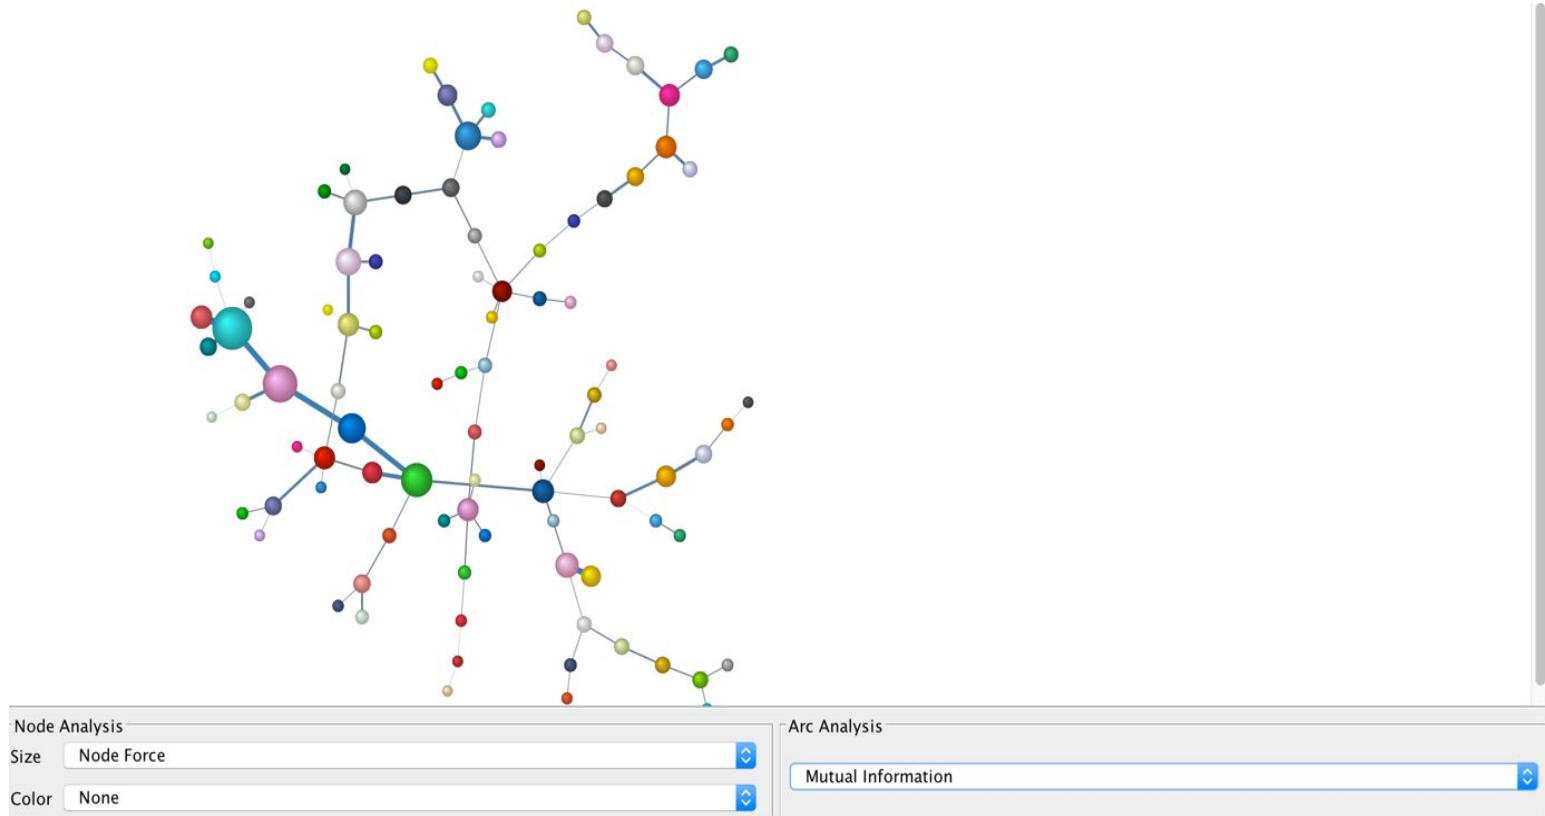

Interpretable layout

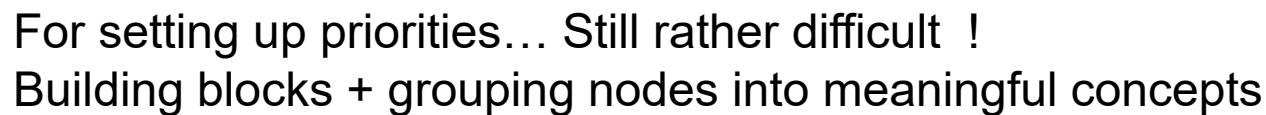

Mapping

This visualization suggests that “vaccine stock out last 3 months”, “service providers trained in vaccine management & logistics”, “energy power source”, “health facility provides routine polio immunization to under 5” or “total overnight beds” to mention a few

Dendrogram

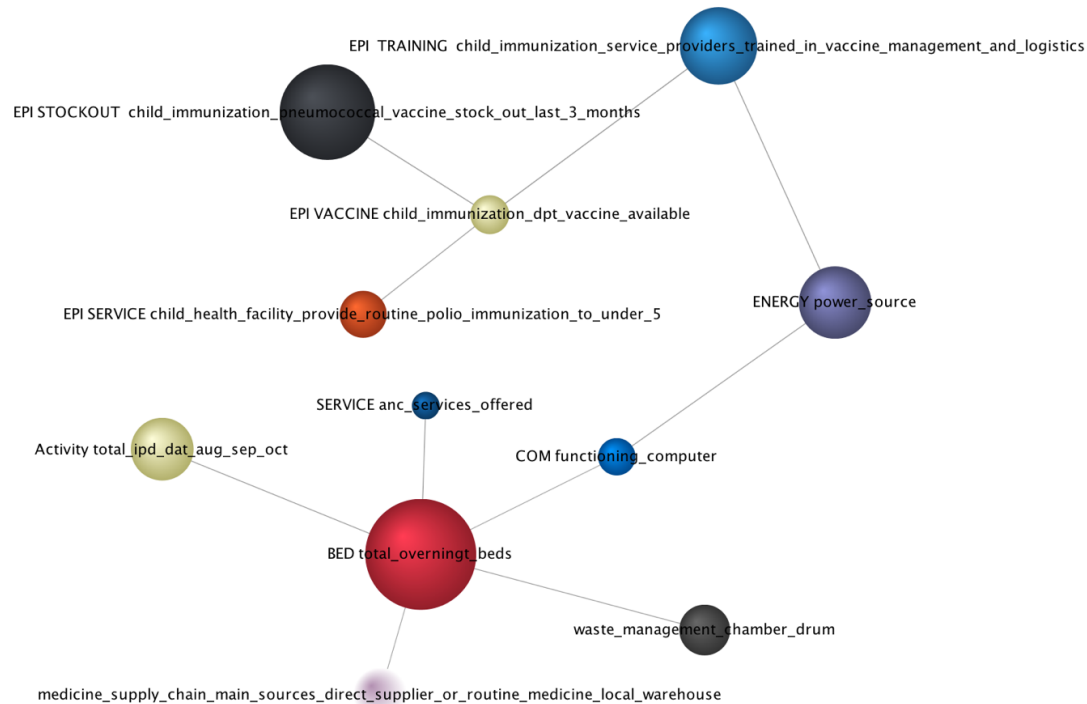

Main sub-components

COLD CHAIN

Vaccines are delicate products **Most critical: national / regional cold store**

TRAINING

Staff turnover rates and the introduction of new vaccines and technologies ...

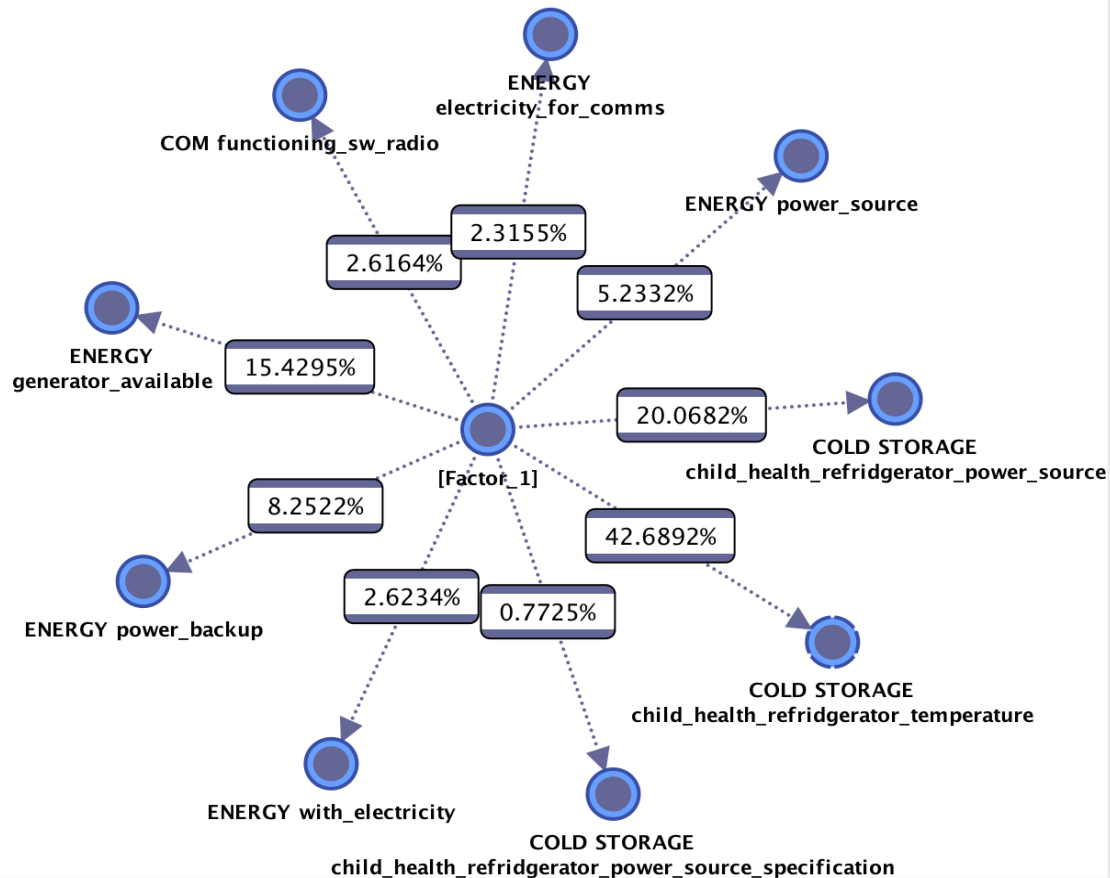

New mindset needed

System thinking skills

Usual approach	Systems thinking approach
Static thinking	Dynamic thinking
focus on events	focus on patterns of behaviour
Systems as effect	Systems as cause
behaviour as externally driven	responsibility for behaviour from internal actors and rules
Tree-by-tree thinking	Forest-thinking
knowledge from understanding details	knowledge from understanding contexts of relationships
Factors thinking	Operational thinking
concentrating on factors that influence or correlate	concentrating on causality and how behaviour is generated
Linear thinking	Loop thinking
view causality running in one direction	View causality as an on-going process with feedback influencing causes

Latent factor can already tell a story ...

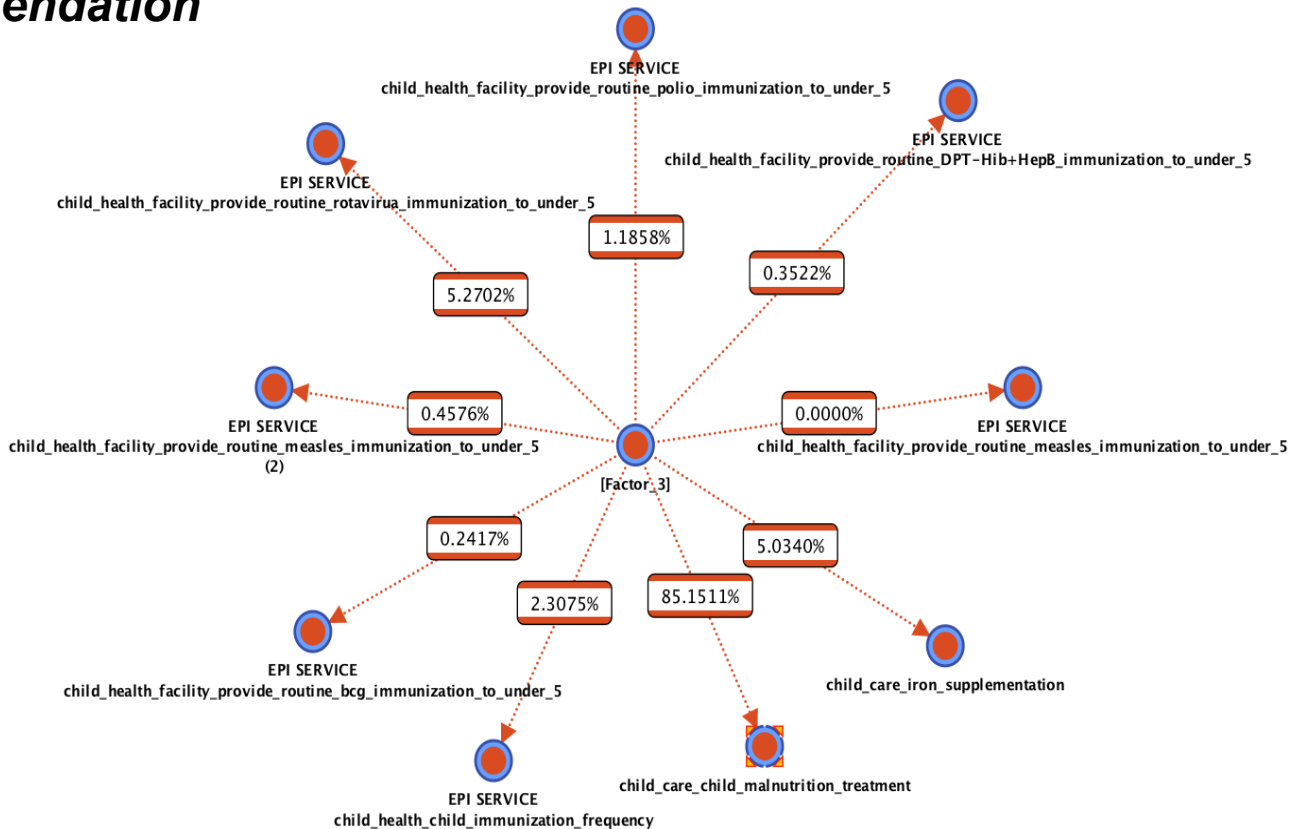

An example of story (Quality assurance) is temperature monitoring...

Factor States/Values

WHO recommends'Every opportunity' or 'vial-opening' recommendation

*multidose
vial for a
small
session size*

*children
are
turned
away*

Commonly used 20-dose Bacillus Calmette Guérin (BCG) vaccine

Introducing the Target Node

The outer ring contains the 91 manifest nodes

the inner ring consists of the 11 factors

the yet-to-be-connected Target Node exclusively with the factors

Supervised Learning

Bayesian network has a structure entirely dedicated to the characterization of a target variable

Target Mean Analysis

TAKE AWAY POINTS

Bayesian Network can be applied to Immunization programs

- As a practically feasible form of knowledge representation Bayesian networks is attractive for exploring **and explaining complex problems**.
- Ability of capturing both qualitative knowledge through their network structure: **Theory of change for Immunization program**, and quantitative knowledge through **health information system**.
- With this approach, **public policy researchers** can quickly and transparently, generate clear recommendations for decision makers.
