

HBOT Helps Heal Sudden Deafness

According to the National Institute on Deafness, most people with sudden hearing loss will recover within two weeks if they receive hyperbaric treatment.

This is the **Patient view** of the brochure.

How Hyperbarics Helps

Regrows nerve fibers

Improves quality of life

Have you experienced sudden hearing loss?

It's scary when you suddenly lose your hearing, whether it's in one ear or both. However, one of the best things you can do is get into a hyperbaric

chamber. Here's a closer look at what sudden deafness is, and how hyperbaric oxygen therapy can treat it.

What is Sudden Deafness?

Sudden deafness, or sensorineural sudden hearing loss (SSHL), occurs when you quickly lose your hearing. This generally happens in one ear and may occur instantly or over several days. SSHL is the most common type of hearing loss among adults

between the ages of 30 and 60 years old, and around 4,000 cases of sudden deafness are diagnosed each year within the U.S. According to National Institute on Deafness and Other

Communication Disorders, about half of the people who have sudden hearing loss will recover within two weeks if they receive hyperbaric

treatment for hearing loss. However, for some people, the condition grows worse over time, particularly if they don't receive prompt treatment.

What are the Symptoms of Sudden Deafness?

Most people only experience hearing loss in one ear with sudden deafness. You might notice it right after waking up in the morning, or when you hold a phone up to the affected ear or use headphones. In some cases, you may even hear a popping sound before you lose hearing.

Other common symptoms include the following:

1. Trouble hearing sounds that are high-pitched
2. Buzzing or ringing sounds in the ear known as tinnitus
3. Difficulty following conversations in a group
Dizziness
4. Inability to hear well if there's significant background noise
5. Conversation sounds become muffled
6. Balance difficulties span

Patient Experiences

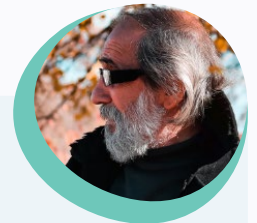

Listen to what real patients have to say about their experiences.

”

George experienced a miraculous recovery in our clinic. During his first treatment session, he regained his full hearing. Nonetheless, George completed all 20 prescribed sessions, just to ensure the recovery was permanent. Most patients respond more slowly, and some do not notice changes until they are near the end of their treatments. We were deeply happy that George's hearing returned to normal.

George, 75

Regained his full hearing capacity right after his first session of HBOT.

”

Wen lost her hearing in her right ear. She was given steroid injections in her ear by her Ear, Nose and Throat (ENT) Doctor, but the steroids did not help. Her ENT then sent her to our clinic for HBOT treatments. Wen recovered approximately half of her normal hearing after approximately her 10th treatment. After having completed her hyperbaric sessions, she had recovered a good deal, but did not experience a total recovery.

Wen, 47

Recovered most of her hearing from HBOT treatment, when injecting steroids didn't help.

”

John, a piano tuner, came into our clinic with sudden deafness. Of course, hearing was critical for his livelihood (but also for him personally). John was able to target the exact day that his hearing returned. After his 16th treatment, his hearing returned sufficiently that he could return to tuning pianos! He was elated, and decided to continue with all of his prescribed 20 treatments, to regain 100% of his hearing.

John, 46

Got healed from sudden deafness and was able to resume work as a piano tuner.

Patients: Get Started with Hyperbarics

Its easy to get started with Hyperbarics. Just follow these simple steps.

1 Give us a call

Did a physician refer you? If so, they can download and fax us back a patient referral form. If not, our medical staff will discuss whether hyperbarics is right for you.

2 We talk with your insurance

Our medical staff contacts Medicare or private insurance to receive authorization and create a plan with you.

3 Patient starts HBOT

Our medical staff meets with the patient to ensure that HBOT is appropriate, and contacts Medicare or private insurance to receive authorization.
