

PVC-U

Service Entry Transition

Gamrat SA offers PVC-U Service Entry Transition as a modern alternative to traditional protective pipes. They allow for easy delivery of the water supply pipe to the building and quick replacement in case of failure. It is possible to extend the transition using a PVC-U pipe with a solvent weld socket.

The connection to the internal installation can be made using:

- · a compression fitting with a socket for PE pipes,
- electrofusion or compression fittings directly on the water supply pipe.
