Notes: ¹⁾ Only in refout mode or with external REF less than 2.525 V and greater than 2.475 V. For external REF out of these limits see leaflet. ²⁾ V_{OUT} is linked to V_{REF} , by conception the difference between these two nodes for $I_p = 0$ is maximum ± 25 mV, $2.475 V < V_{OUT} < 2.525 V$. ³⁾ In Refout mode at $T_A = 25^\circ C$, $2.475 V < V_{REF} < 2.525 V$. The minimal impedance loading the ref pin should be $> 220 k\Omega$. Internal impedance = 600 Ω . For most applications you need to buffer this output to feed it into an ADC for example. ⁴⁾ To overdrive the REF (1.9 V .. 2.7 V) maxi ± 1 mA is needed.

⁵⁾ $I_S = I_p / N_S$. ⁶⁾ Only due to TCR_{IM} .

Safety

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (eg. primary busbar, power supply). Ignoring this warning can lead to injury and/or cause serious damage. This transducer is a built-in device, whose conducting parts must be inaccessible after installation. A protective housing or additional shield could be used. Main supply must be able to be disconnected.
