

## DIRECTIONS FOR USE

### 1 Locating Active Tunnels

- Use a 1/2" dowel or stick to puncture holes in tunnels. Mark holes with lawn flags, or another easy to spot item. Be careful not to crush runway.
- Inspect after 24 hours. Sealed holes indicate mole activity.

### 3 Setting The Trap

- Position trap so that the indentation made in step 2a is centered between the trap's jaws. Insert jaws into tunnel so that tunnel is perpendicular to trap.
- Trap straight down on end of yellow foot pedal. Be careful not to cover slot in foot pedal.
- Work foot pedal down until trigger post comes through slot.
- Use foot or finger to press trigger post flush with foot pedal. The trap is now set.

**TIP 1:** If trap will not set, check that indentation made in Step 2a is at correct depth.  
**TIP 2:** If trap will not set after several attempts move to a new location and repeat steps 2 & 3.

\* If soil is extremely hard or rocky, use a spade to pre-cut slots for trap jaws.

**CAUTION**  
 This trap exerts considerable force when activated.  
 DO NOT USE IN AREAS EXPOSED TO CHILDREN OR PETS.

### 2 Preparing To Set The Trap

- Use hand to create 1" indentation for trigger in middle of active tunnel.
- Built-in Depth Gauge should fit into indentation to confirm correct depth.

### 4 Mole Capture & Removal

- A raised foot pedal indicates a capture.
- Set trap on bucket and release dead mole by compressing pedal with hands.

### 5 Moving & Resetting Mole Trap

If trap has not triggered after 24 to 48 hours, trap may be moved to a new location. Place foot lightly on pedal and use dowel stick to press the safety release button. Trap will spring upward, when latch is released. Remove trap and move to another active runway, repeating steps 2 and 3 to reset trap.
