Co-creation and intervention adaptation for implementation in LMICs

Mariantonia Lemos
Maria del Pilar Guevara
Laura Ceballos

Agenda

1. Presentation: Connect dots
2. EVO+ and Motivator
3. Culture adaptations and co-creation
4. Process of cultural adaptation
5. TDF activity
6. Co- creation activities

https://www.youtube.com/watch?v=Kn_hQJ6Yk-Y

Culture (Barrera et al, 2013)

Complex and multidimensional construct.

Totality of a group's knowledge, transmitted from elders to children, which includes observable entities and cognitive entities.

A cultural adaptation should incorporate observable aspects into treatment media and activities; and cognitive entities into intervention content.

Cultural adaptations

Universal approach
Original interventions could be
applicable without alterations.

(Falicov, 2009)

The systematic modification of an
evidence based intervention should
consider language, culture, context.

(Bernal & Domenech, 2009)

Culture-specific approach
Emphasizes culturally grounded
content.

(Falicov, 2009)

Co-creation

It implies developing a process for understanding, developing and supporting mutual learning between multiple participants in collective decision-making.

Co-creation

People affected by projects should have a voice throughout the overall process.

It implies developing a process for understanding, developing and supporting mutual learning between multiple participants in collective decision-making.

Co-creation

People affected by projects should have a voice throughout the overall process.

It implies developing process for understanding, developing and supporting mutual learning between multiple participants in collective decision-making.

Researchers are responsible for creating inclusive activities that boost participation of the community.

Co-creation

People affected by projects should have a voice throughout the overall process.

It implies developing a process for understanding, developing and supporting mutual learning between multiple participants in collective decision-making.

Researchers are responsible for creating inclusive activities that boost participation of the community.

The process will only succeed if an inclusive and democratic solution is achieved.

Developing a
process of
collaborative
design includes
answering some
questions...

Who needs to take part in the
design process?

How should participants be
supported?

What kind of methodologies
and tools would you use to
include them?

Process of cultural adaptations of EBIs

(Barrera and Castro, 2009)

Information gathering

- ☑ Purpose: determine whether the adaptation is justified, and which intervention components might be modified.
- ☑ It is important to understand if subgroups can differ in the theoretical mechanisms (Self-efficacy, risk perception, etc.) that explain health outcomes.
- ☑ Culturally specific mechanisms suggest the need for unique intervention components that differ from the original intervention.

Structural barriers

VS

Individual barriers

Structural barriers such as lack of health services, difficulties in accessing the services could be overcome with low intensity interventions.

Individual barriers such as language and cultural barriers could be overcome considering cultural aspects in the intervention development/adaptation.

Cultural aspects of Latino cultures

(Bernal & Saez Santiago, 2006)

Personalismo (personal contact).

Marianismo (central role of women in families).

Familismo(familism)—the familiar system contributes to the development and maintenance of health promoting and healthdamagingbehaviours

Colombian context

Geography

Language

Educational level

Food insecurity

Accesibility

Activities

- Literature search is focused on identified studies that show subcultural group differences.
- Studies to determine how well the original intervention would fit the needs and preferences of subcultural groups.

Systematic reviews: nutrition and physical activity

Focus groups

This is Antioquia

Sources of behaviour

TDF Domains

Soc - Social influences

Env - Environmental Context and Resources

Id - Social/Professional Role and Identity

Bel Cap - Beliefs about Capabilities

Opt - Optimism

Int - Intentions

Goals - Goals

Bel Cons - Beliefs about Consequences

Reinf - Reinforcement

Em - Emotion

Know - Knowledge

Cog - Cognitive and interpersonal skills

Mem - Memory, Attention and Decision Processes

Beh Reg - Behavioural Regulation

Phys - Physical skills

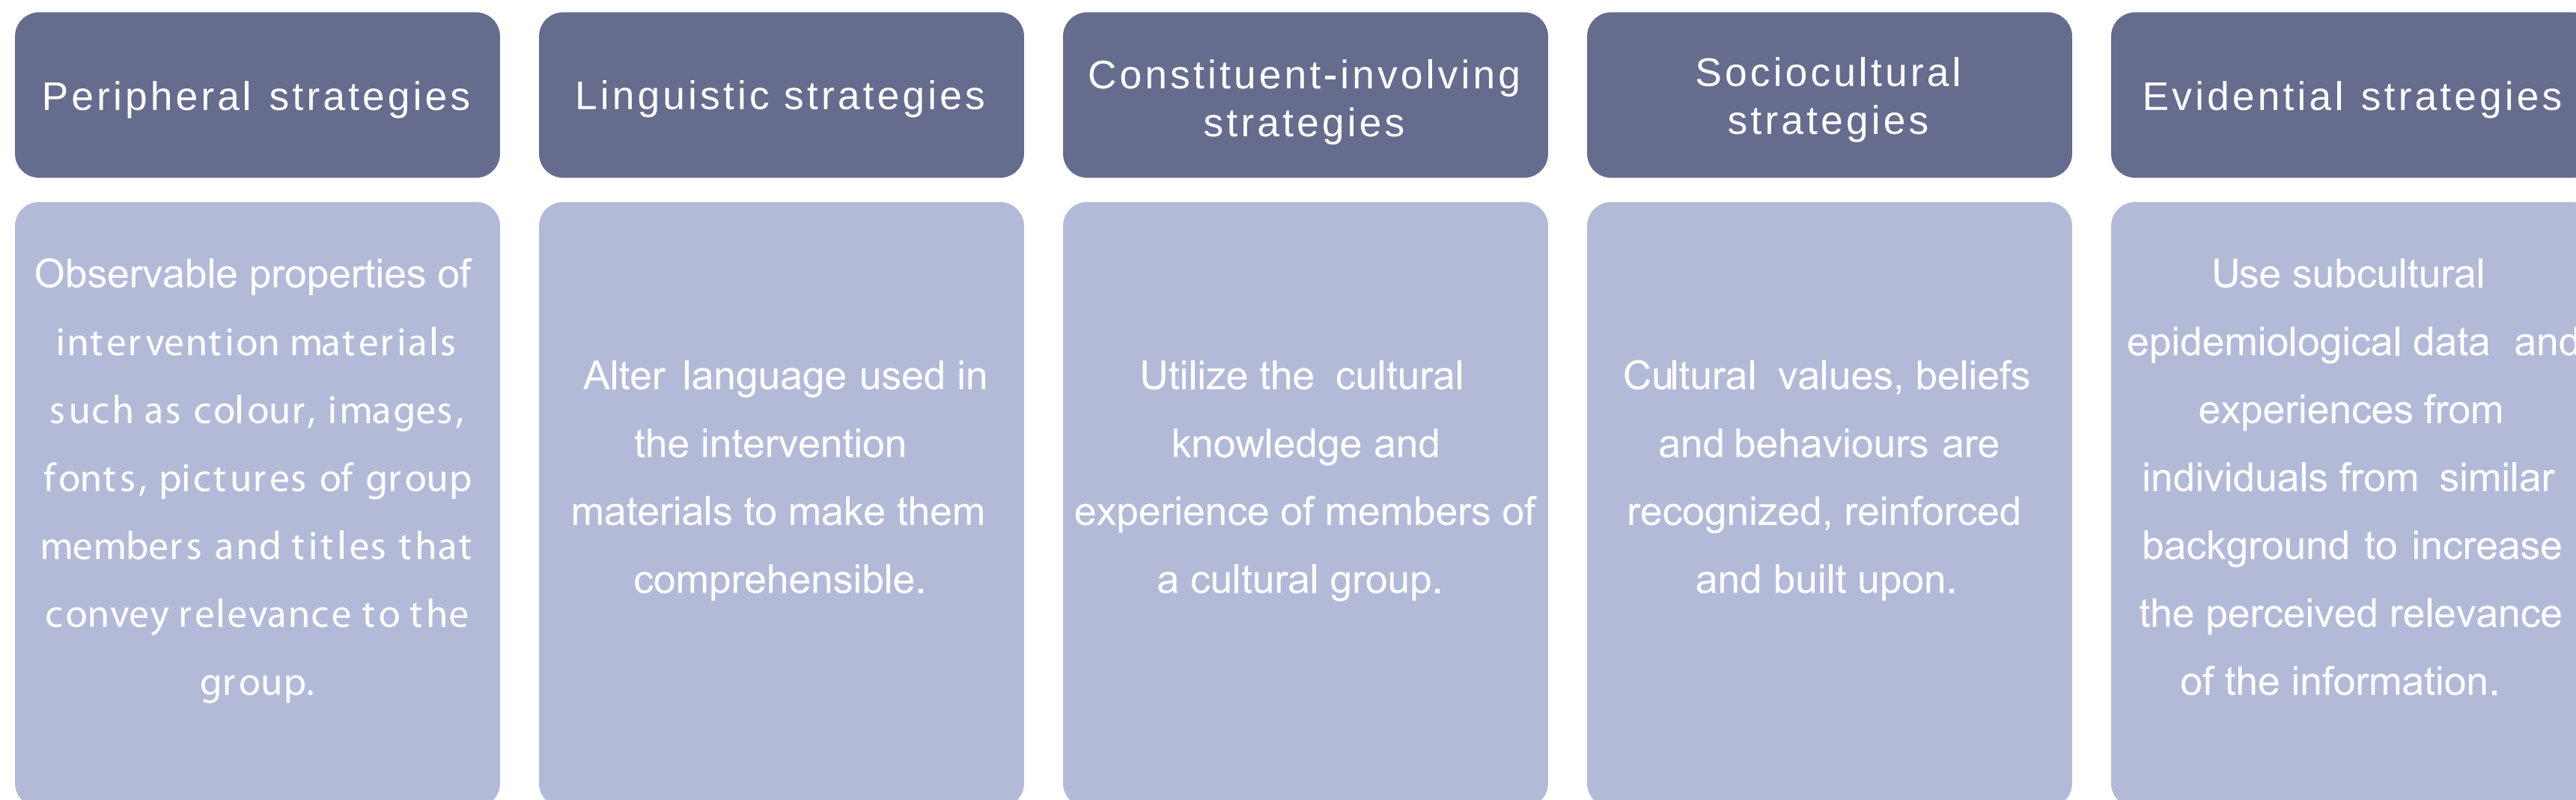

(Atkins et al, 2017)

Preliminary adaptation design

- ✓ Information is integrated to inform preliminary modification of the original intervention.
- ✓ Core components are not altered unless there is convincing evidence from the stage 1.
- ✓ Adaptations require language translations or reading-level adjustments. Literal translations of idioms might not be possible, and non-equivalent translations have a profound impact.
- ✓ Focus groups or advisory panels should review the preliminary versions of the adaptation to identify problematic features.
- ✓ This stage also includes usability testing to identify and address issues related with technological components of the intervention. (Think-aloud methods could be useful)

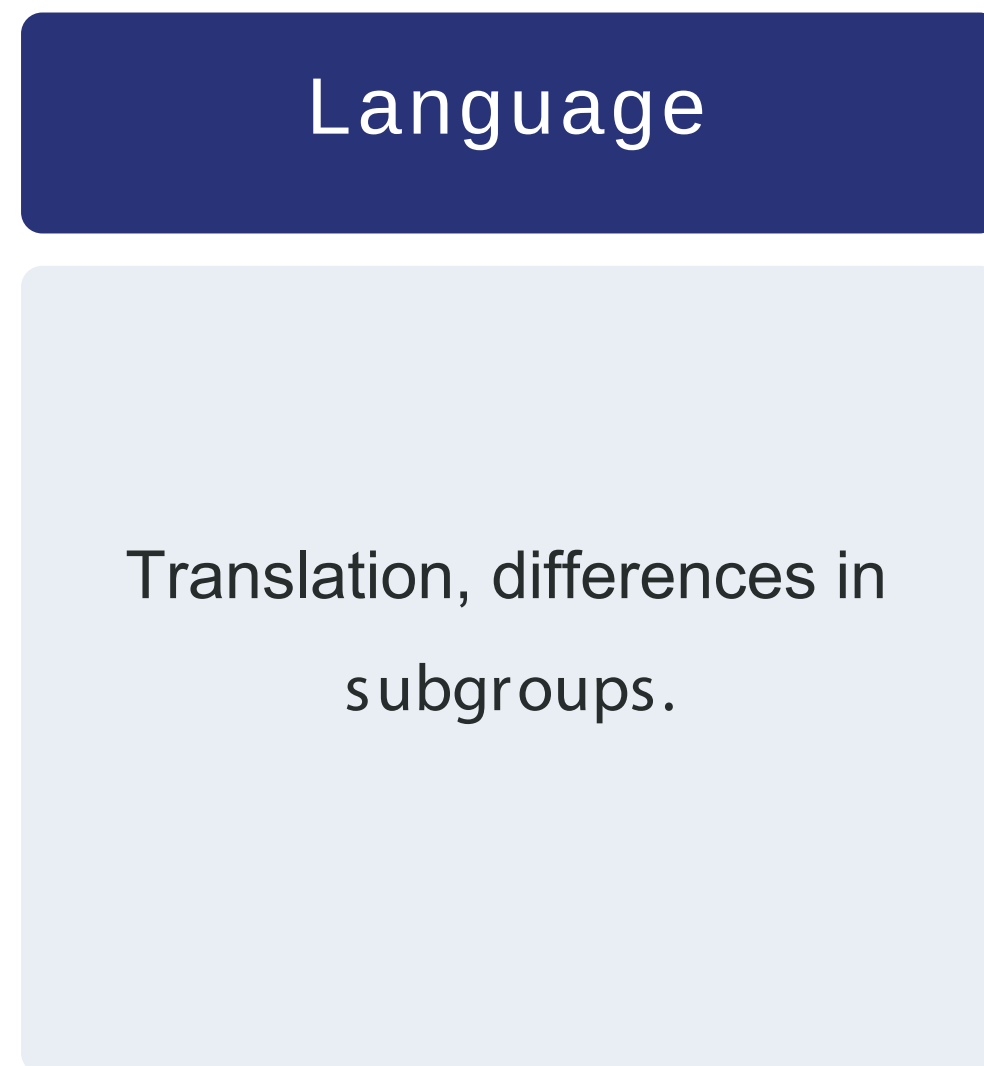

What is adapted in a cultural adaptation

(Kreuter et al, 2003)

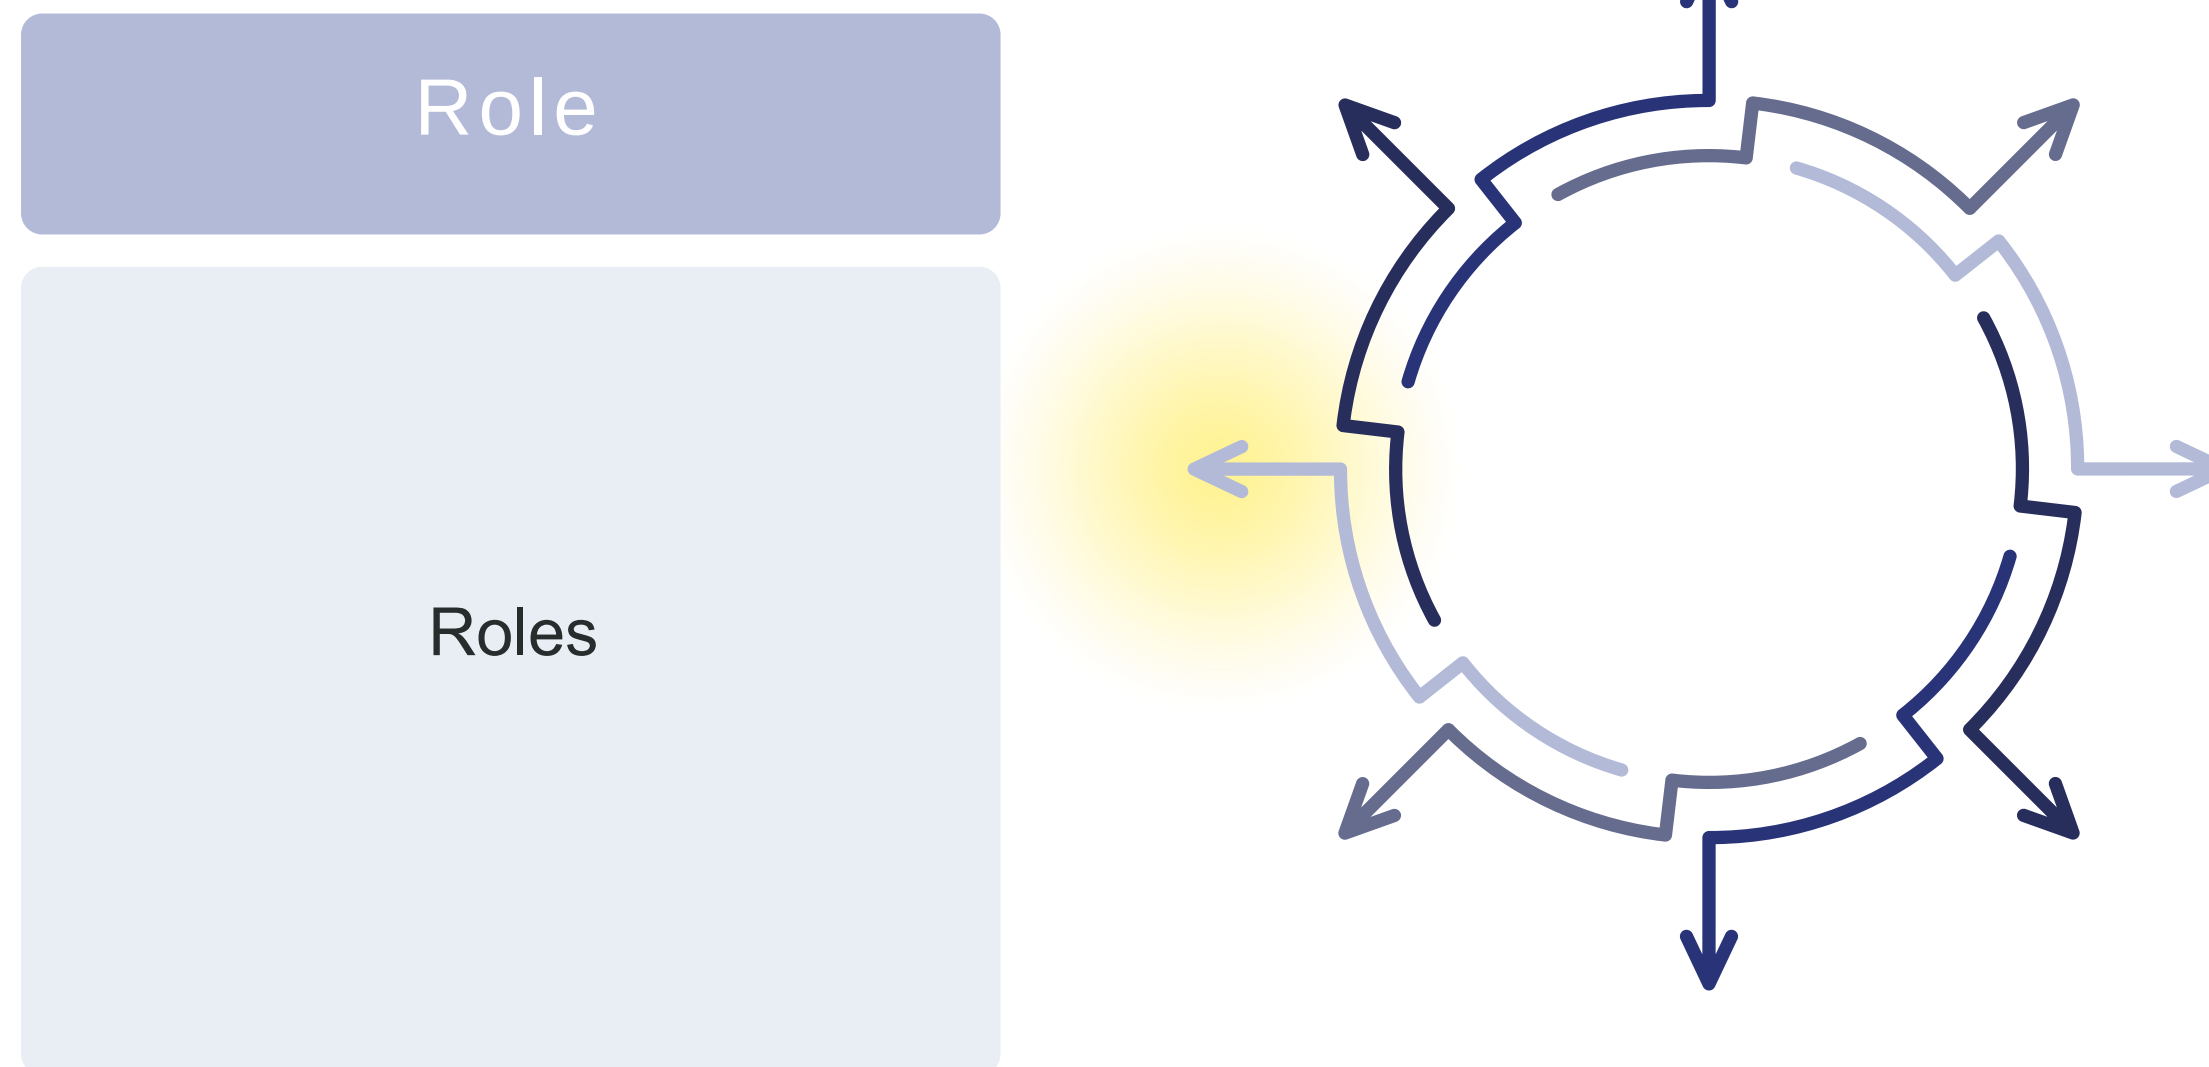

Ecological validity model

(Bernal et al, 1995)

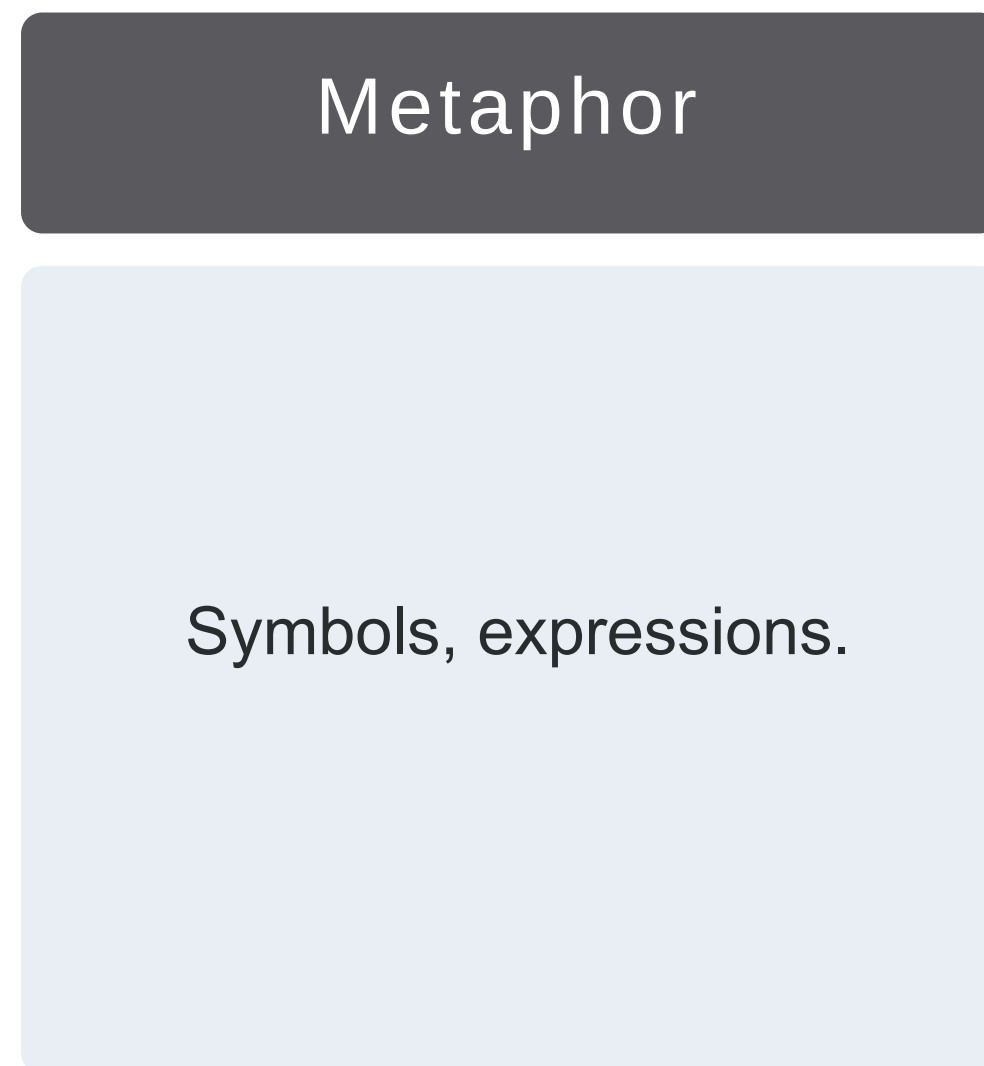

Ecological validity model

Cultural adaptation considerations (Spanhel et al, 2021)

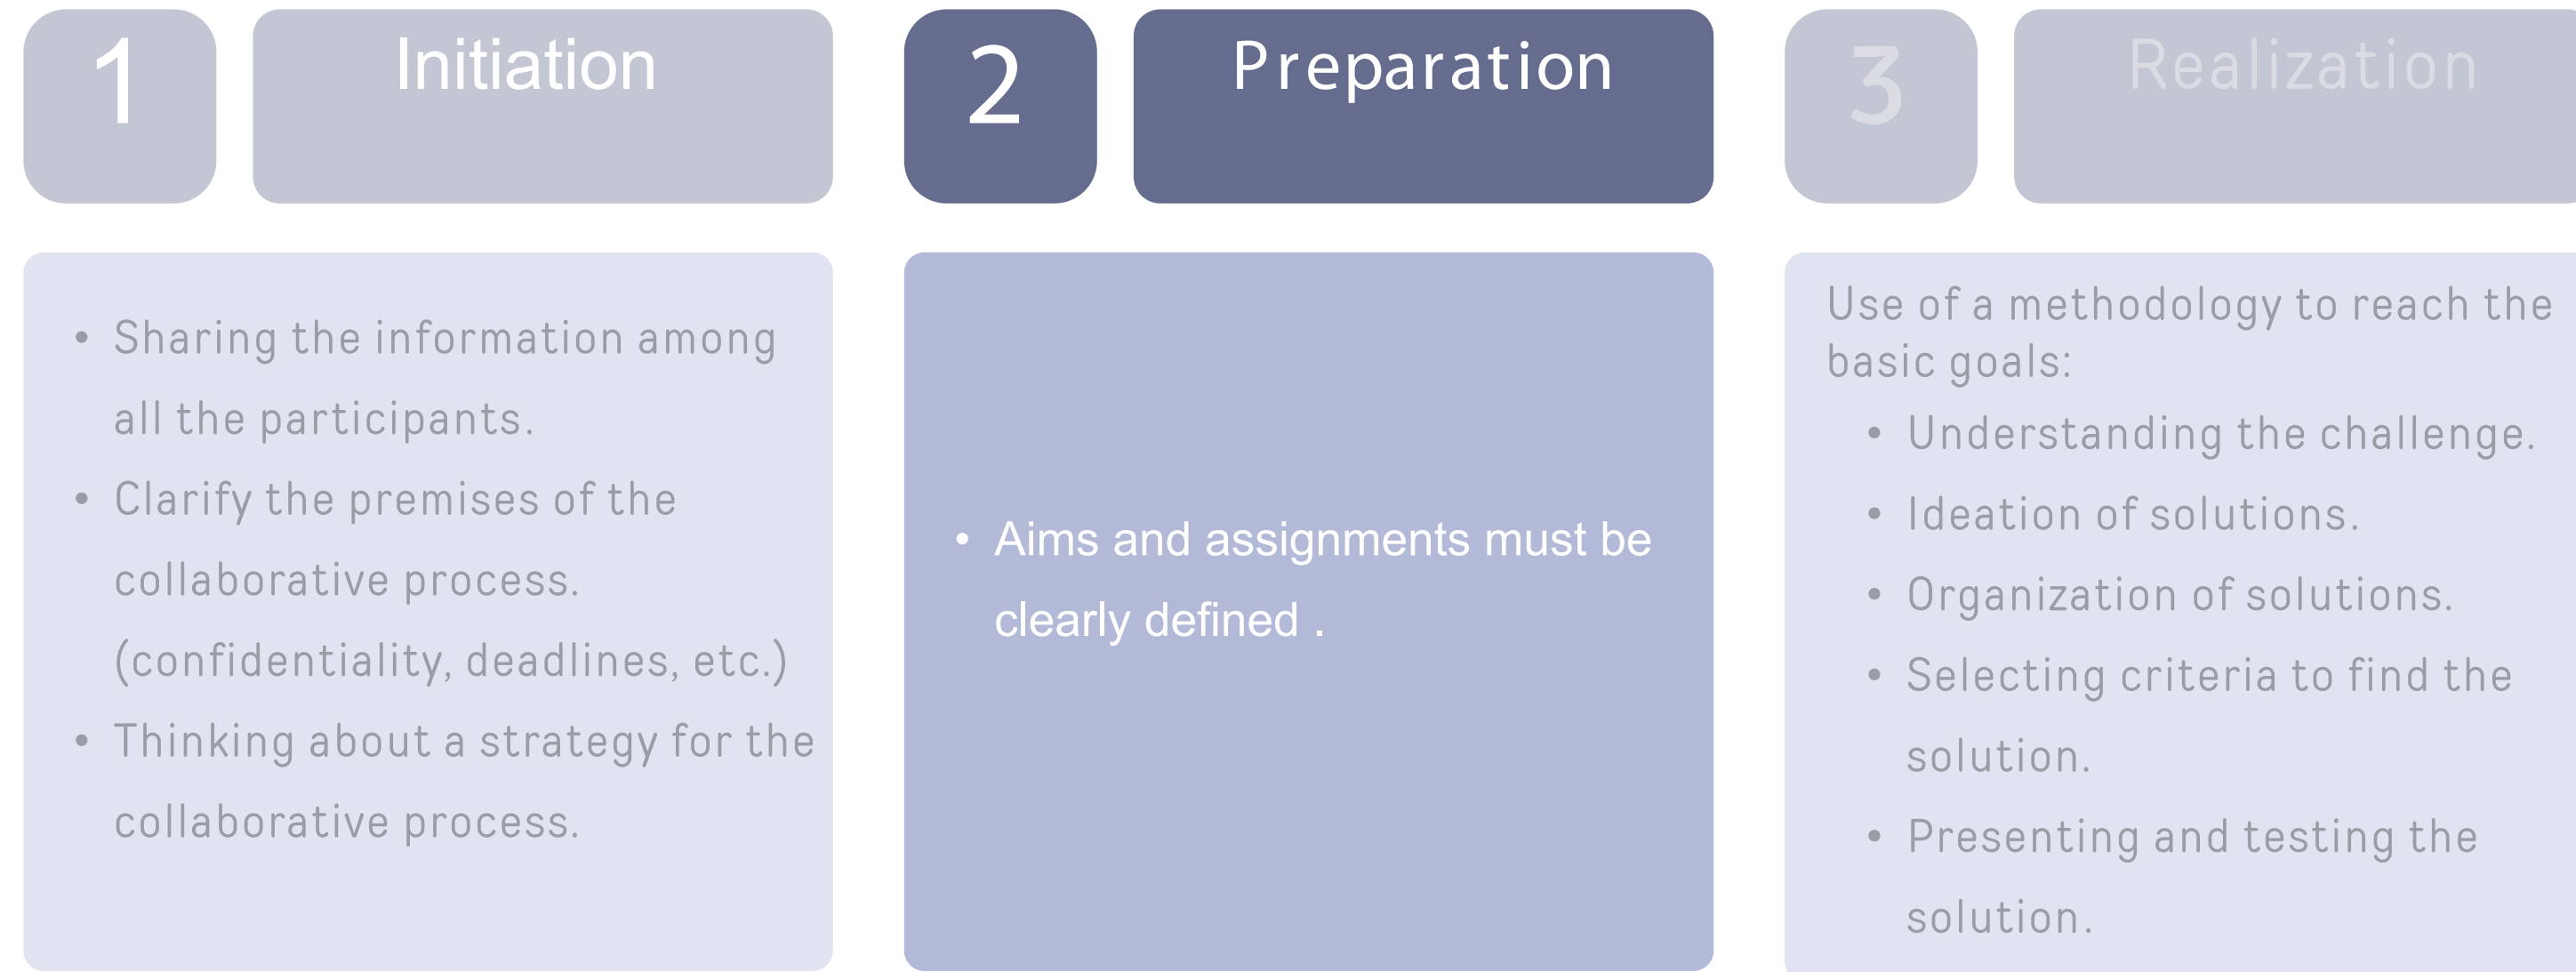

Preliminary adaptation design

Content	Methods	Procedures
1. Illustrated characters.	1. Structure and length of the intervention.	1. Methods for obtaining information.
2. Illustrated activities.	2. Functionality and simplicity of the intervention.	2. Persons involved in tool development.
3. Illustrated environment/burdens.	3. Design and aesthetics of the tool.	3. Theoretical framework of tool and intervention
4. Illustrated values/traditions.	4. Amount and style of guidance provided by the tool.	
5. Language translation.		
6. Language simplification.		
7. Visualization of language.		
8. Difference in concepts of health.		
9. Goals of treatment.		
10. Methods of treatment.		

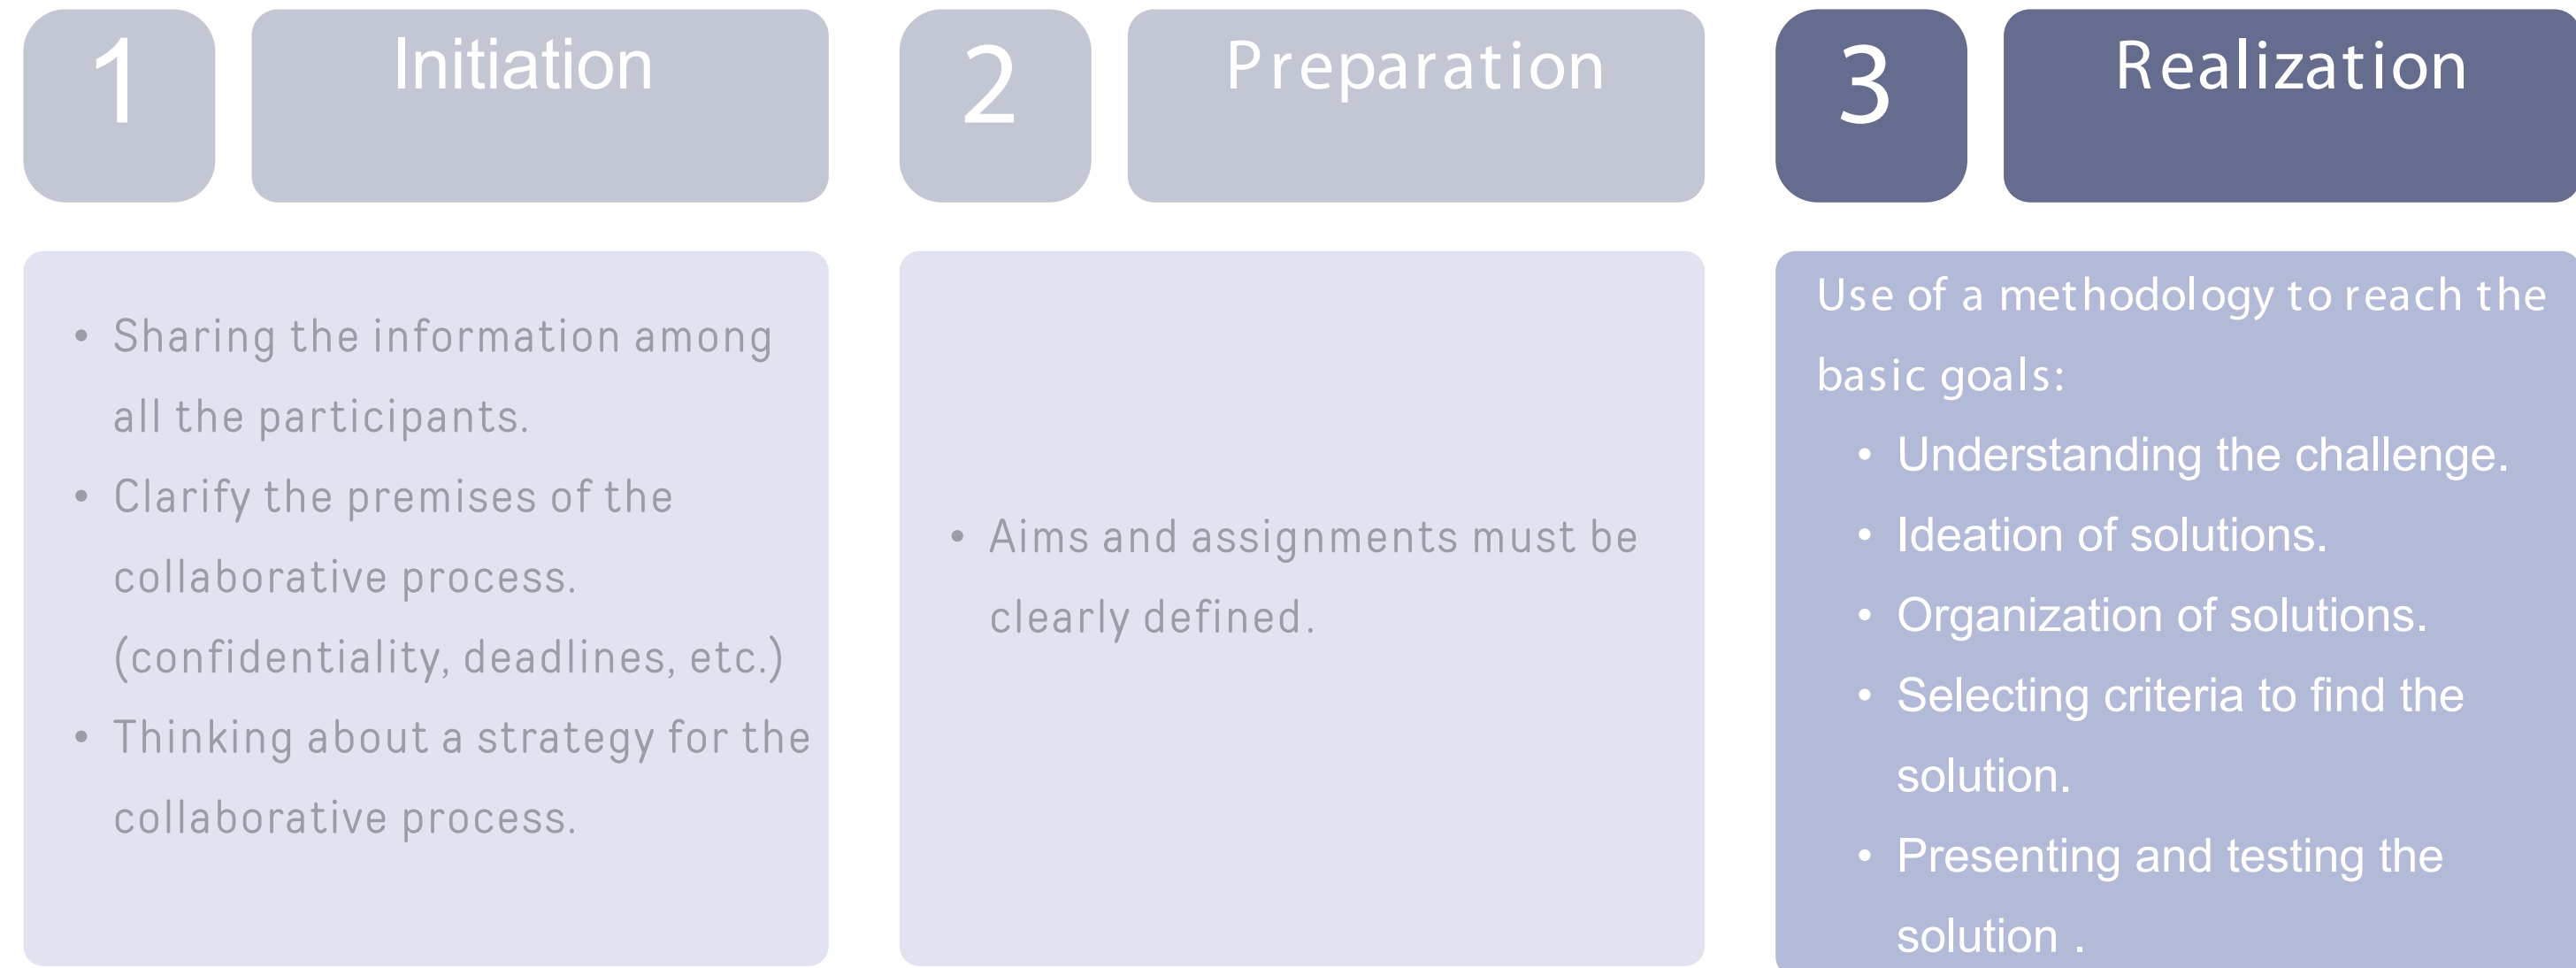

How to co-create

How to co-create

How to co-create

Activity:

Reverse brainstorming

- ☑ Identify a design challenge
- ☑ Think “How can I make it worse?”
- ☑ Brainstorm to figure out all possible reverse solutions
- ☑ Flip the reverse solutions to create real design solutions
- ☑ Evaluate and decide if a real solution can be formed

Activity:

Crazy8

- ☑ Divide your sheet in 8 equal blocks
- ☑ Name each block after each of the identified challenges
- ☑ Write down quick ideas of possible solutions: anything goes
- ☑ Help us presenting and explaining your ideas

Co-Creation in EVO

Evo+ Team

Translation of the materials.

Health care professionals

Review the contents and assess their relevance.

Make suggestions for new content.

Patients

What do they want to know?

Assessing the relevance and feasibility of the recommendations.

Excecutive committee

Analyze the results of the focus groups and these activities.

Preliminary adaptation testing

- ✓ After drafting a preliminary pilot version, testing is recommended
- ✓ Feedback for staff members who implemented the pilot intervention can be particularly valuable.
- ✓ During this phase, measures that will be used in the efficacy trial can be piloted. This is the opportunity to evaluate the quality of measure translations and the clarity of instructions, items and response scales.

Adaptation refinement

Feedback from the pilot trial is used to make changes to the preliminary adaptation.

Decisions made at this stage require informed judgements from leadership teams and could include investigators and staff, a community advisory panel and subcultural group members.

Cultural adaptation trial

- Empirical trial of the cultural adaptation produced in the prior stages.
- ✓ Often is done in a two-armed study in which the cultural adaptation is compared with a control condition.
- ✓ Finer-grained analyses are included to evaluate the strengths and weaknesses of the adaptation.
- ✓ This could include moderator analyses that examine interactions between intervention conditions and participants background characteristics such as education and health literacy.

EVO Timeline

The debate of fidelity: core vs peripheral adaptations

(Chu & Leino, 2017)

- ☒ Fidelity to treatment protocols should be preserved in evidence-based interventions to ensure that potential users are privy to EBI components as originally validated.
- ☒ The adaptation of core components might result in a novel intervention that could be ineffective.
- ☒ Cultural adaptation does not modify core active treatment components, instead it provides add-ons to make treatments more palatable and relevant to some groups.

Cultural Treatment Adaptation Framework

(CTAF– Chu & Leino, 2017)

Always report...

WHAT

What specific components were adapted

HOW

How the specific components should be changed

WHY

Why the adaptation is necessary
