„If that happens“

„After the customer has“

„Notify me if“

„After inserting data into“

„We need to check the status of“

„When we have called System X“

Ubiquitous Language?

Domain Events are something
that happened that Domain
Experts care about

Model information about
activity in the domain as a
series of discrete events.

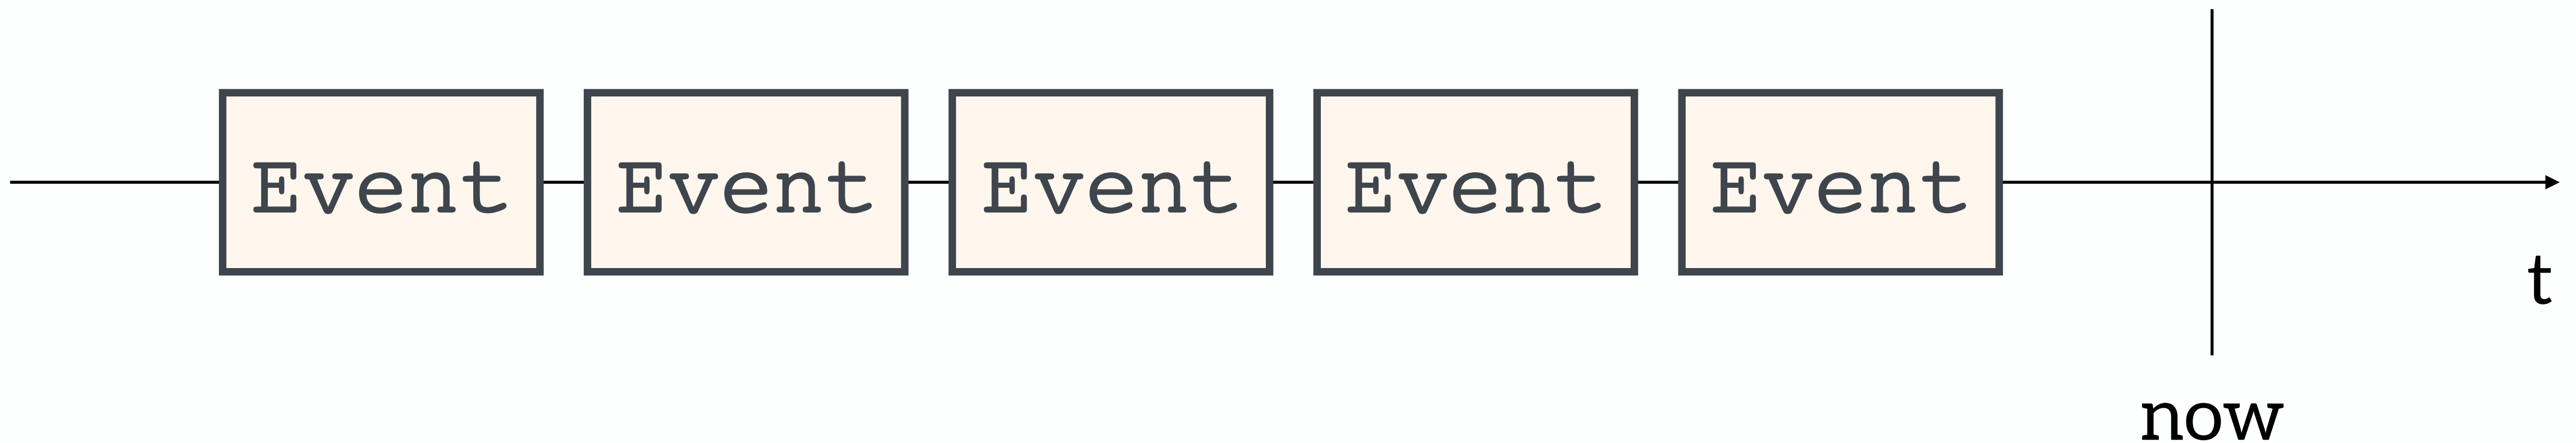

Events are easy to grasp

Events have a simple semantic

Events can be placed on a timeline

An event is something
that happened in the past

The names of the events are part of the
Ubiquitous Language

Commands can change business object state. Which can result in one or more Events being published

Command

The diagram illustrates a sequence of three components: a brown box labeled 'Command', a green box labeled 'Business Object', and a stack of blue boxes labeled 'Event'. The boxes are arranged horizontally from left to right, indicating a flow or process. The 'Event' box is depicted as a stack of three overlapping rectangles, suggesting multiple events can be published.

Options for Event Payload

Options

Full Payload

The event carries complete Entity-Graphs or Aggregates

REST URL

The event only carries a URL to a RESTful HTTP Ressource

Empty

The event is empty or contains only minimal data and is being used to trigger pulling from a feed (eg. Atom)

Mix

The event contains data that is usually of interest to many other contexts. For special purposes there is also a URL to a RESTful HTTP Ressource

CustomerCreatedEvent

```
{
  "eventId": "4567854",
  "eventTimestamp": „12398989343“,
  "eventType": "CustomerCreatedEvent",
  "customerName": "Michael",
  "customerLastName": "Plöd",
  "customerNumber": "34ed2345",
  "address" :
  {
    "street": "Kreuzstr. 16",
    "postCode": "80331",
    "city": "München"
  }
}
```

Full Payload

Events contain full object graphs

Consumers do have all the data they need

„Invitation“ to a high degree of coupling between event and consumer

CustomerCreatedEvent

```
{  
  "eventId": "4567854",  
  "eventTimestamp": „12398989343",  
  "eventType": "CustomerCreatedEvent",  
  "url": "http://123.03.24.23/event/2"  
}
```

REST URL

Events only contain a URL to a REST resource for the event data

If consumers need the data they can obtain it but don't have to

Synchronous communication, but no service discovery

CustomerCreatedEvent

```
{  
  "eventId": "4567854",  
  "eventTimestamp": „12398989343“,  
  "eventType": "CustomerCreatedEvent",  
}
```

Empty

Events contain no data at all

Consumers would usually
consume an (ATOM) Feed

Consumers need to know the
Source of the Feed

CustomerCreatedEvent

```
{  
  "eventId": "4567854",  
  "eventTimestamp": „12398989343",  
  "eventType": "CustomerCreatedEvent",  
  "customerLastName": "Plöd",  
  "customerNumber": "34ed2345",  
  "url": "http://123.03.24.23/event/2"  
}
```

MIX

Events contain some data

Additional data can be obtained
by calling as REST Resource

Good compromise in many
occasions

How do I identify events?

Event Storming

Overview

- › Workshop moderation format
- › Invented by Alberto Brandolini
- › Analysis of requirements based on events

Source: <http://ziobrando.blogspot.de/2013/11/introducing-event-storming.html>

Event Storming is highly analog

Explore the domain starting
from Domain Events

Invite the right people

Explore the the origins of
Domain Events

Avoid tables / chairs
in the room

Look for Aggregates

Provide unlimited
modelling space

Use A LOT of sticky notes
