ACR SmartReader 4

Monitors Airframe Doors

A leading aircraft manufacturer was experiencing problems with airframe door temperatures that impacted on the comfort of passengers and crew seated adjacent to the doors. With variances in temperature, relative humidity and air pressure it was difficult to isolate and correct the problem on the ground. Lightweight, portable ACR SmartReader 4 (Pressure, Temperature and RH) data loggers were used to unobtrusively collect the in-flight data, that provided the engineers with sufficient information, to diagnose and solve the problem.

Another data-logging solution from ACR Systems.
