

# SmartReader Plus 2

Optimizing the Life of Nuclear Power Plant Machinery

The maintenance procedures for U.S. nuclear power plants are quite stringent. One of ACR's dealers has specialized in selling the SmartReader Plus series, especially the SRP 2, to the maintenance departments of these nuclear power plants. They are used to assess the atmospheric conditions that can contribute to machinery degradation and failure. By monitoring the ambient conditions, technicians can optimize the life of the machinery and facilities. Thus reducing the risk of failure in any part of the plant's overall operation.
