

Fluke Calibration 525B Temperature/Pressure Calibrator Quick Reference Guide

Calibration

Sourcing (Output)

<u>STBY</u> OPR For Volts, mA and RTD (All others are active when selected)

Setting setpoints (Output only; example is for TC)

- Select desired output type.
- →• Enter setpoint value 1 2 3 4 ENTER
 Then:
 SHIFT
 SET
 1
 Press # of setpoint (1-9).
 → Repeat up to nine times.

Calibrator function keys reference

No	Name	Description
1	RNG LOCK	Activates/deactivates the autorange feature of the calibrator in voltage source modes.
2	SET	Used to program a setpoint step for any output mode. Key in the desired output and press $[\text{SHFT}]$ SETPOINT # appears on the display. Select a setpoint number from 1 to 9. The output you entered can now be recalled or used in the AUTOSET key described later in this manual.
		Each TC type, each RTD/OHMS type, mA, and volts each have 9 programmable setpoints.
3	cjc 5	Toggles between the internal and external cold junction reference locations.
4	SETUP 4	 Press ENTER to scroll through the LCD backlight, interface, and address menus. Use and to adjust LCD backlight when the LCD menu is displayed. Use and to to toggle between serial and GPIB interface when the Interface menu is displayed. Use and to scroll from address: 1 to address 30 when the address menu is displayed.

Recalling setpoints

 \square Press # of setpoint to recall (1-9).

Repeat for ALL setpoints desired.

AutoSet (Automatic timed setpoint)

Uses setpoints already programmed.

- Press # of setpoints to use as auto setpoints (1-9).

- Press # of seconds to pause and hold setpoints (dwell time) (5-500 sec) ENTER Setpoints cycle starting at setpoint #1 through # of setpoints selected.

Then cycle down to #1 – Repeats until any button on panel is pressed.

No	Name	Description
5	OUTPUT 7	Selects output mode.
6	INPUT 8	Selects input mode.
7	ZERO 9	Zeros the pressure module reading when in pressure measurement mode. Zeros the thermocouple TC mV/°C offset when in TC measurement mode.
8	C°/F°	Toggles between centigrade and Fahrenheit when you are using the TC or RTD functions.
9	AUTOSET 3	AUTOSET runs through the setpoints you entered using the SET function. Press $\boxed{\text{SHIFT}}$ $\boxed{3}$. AUTO SET POINT? appears on the display.
		Enter a number between 1 and 9 that corresponds to the number of setpoints being used. DWELL TIME 5-500? appears on the display. Dwell time is the number of seconds between each setpoint. The output cycles through each setpoint and then reverses the order. For example, if 5 is entered for the number of setpoints, the Calibrator cycles through setpoints1, 2, 3, 4, 5 and then reverses to setpoints 4, 3, 2, and 1.
		Δ Caution
		Setpoints of 30 V or greater will not go to standby when you use this feature.
(10)	EXP •	Used to enter an exponent when you define a custom RTD.
(11)	RECALL	Used to recall a programmed set point.
	2	Press $[HF]$ 2. RECALL SPT # appears on the display. Enter the number of the output setpoint that you want to use. The output will then be programmed to the setpoint you entered.
(12)	LOCAL 0	Used to regain local control of the calibrator. If you set the calibrator to a remote state using the remote commands, all the front panel keys are locked out except the Local key. When you press the Local key, the front panel is unlocked.
		Note This function does not work when you set the Calibrator using the Remote with Lockout command. In Remote with Lockout mode, ALL keys are locked out and the Local key will not unlock the front panel.
