Testing

Vibration testing at the product development stage

A high-spec, high-quality versatile measuring device

20 MS/sec sampling speed

Perform multi-channel, high-speed sampling at 20 M samples/sec (time axis resolution: 50 nsec) for all channels at the same time.

High-speed sampling allows you to measure the rising edge of pulses and detect anomaly operations and instantaneous waveforms that occur suddenly with high precision.

Observe the rising edge of pulses

Input amp with integrated A/D converter

Isolated input for all channels

Connections between analog input channels, and between the input channel and the main unit, are isolated by isolation elements. So potential differences can be measured without any concerns, just like with an oscilloscope.

Isolation element

A4 size built-in printer

Print large, high-definition hard copies for easy on-site checking. Paper is easy to replace by inserting a new roll, rolling out the paper slightly, and then closing the cover.

Simply open the cover, insert the new paper, and then close the cover.

Abundant modules

Hioki has added new high-performance modules in response to overwhelming demand.

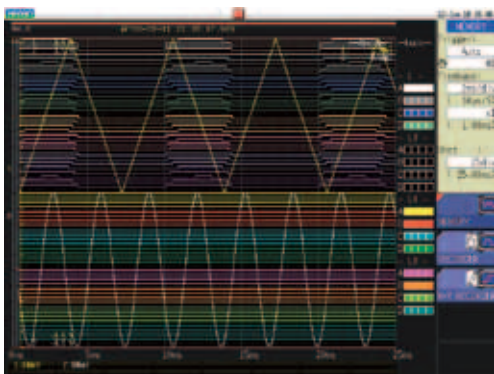

The Memory HiCorder now supports a wide variety of measurements.

64 logic input channels +10 analog channels

The MR8847A has 16 built-in logic input channels. Add 3 logic input units to record a total of 64 channels at once. You can also display the waveforms for all channels on a single screen—ideal for timing measurements.

Up to 10 channels of analog waveforms can be recorded at the same time for efficiency.

Measure and display multiple relays at the same time

Large 512 MW capacity (MR8847-53 only)

Hioki has developed an internal storage FPGA for super-high-speed access. Used in combination with large capacity high-speed memory, this enables many hours of high-speed sampling to be recorded.

NEW SSD 128 GB storage media

The new internal SSD unit (available as an additional option) has 128 GB of capacity, allowing large amounts of data to be stored.

Durable design, with resistance to dropping up to 50 cm

The MR8847A is resistant to strong mechanical shock and vibration, such as short drops.

The durable design has been tested to withstand vertical drops of up to 50 cm.

* Tested based on in-house conditions. A dropped unit is not guaranteed to be free of damage or trouble.

HIGH VOLTAGE UNIT U8974

Directly input high voltage without a differential probe

2 channels, banana input terminal
Both channels support 1000 V input

1000 V DC, 700 V AC high-voltage direct input

Since you can directly input up to 1000 V DC and 700 V AC, a differential probe is no longer necessary. Maximum rated voltage to ground is 1000 V for CAT III and 600 V for CAT IV environments.

Global power supply line measurement

Ideal for primary and secondary measurements of UPS power supplies and commercial power supply transformers, and for recording the primary and secondary waveforms of inverters. It can also be used to measure high-voltage power supply lines, such as 380 V and 480 V systems used in many countries.

Supports high voltage systems around the world

Applicable to a variety of characteristics tests

Maximum 1 MS/s high-speed sampling and 16-bit resolution allow the MR8847A to be used for interruption testing and switch testing.

The voltage of each battery cell can be input separately. This uses 1000 V DC input, which can withstand even if high voltage is applied when a cell shorts.

The digital voltmeter unit, which allows input up to 500 V DC, is suitable for the testing of individual battery cells.

Transformer Dump Tests

Interchannel isolation allows for safe circuit connections. Simultaneous high-speed sampling can record waveforms before and after the dump. Input large numbers of control and circuit signals.

Recommended units

Application of each unit allows analysis of the correlation between voltage before and after the interruption of a generator, RPM fluctuation rate, governor servo motor operation conditions, and suppression machine switch timing.

- Maximum 1 MS/s high-speed sampling and 16-bit resolution in the high-voltage unit allow the MR8847A to be used for interruption and switch testing.

ARBITRARY WAVEFORM GENERATOR UNIT U8793

Generate and record in a single unit

Output and record results seamlessly

Just one MEMORY HiCORDER gives you a function generator mode, arbitrary waveform generator mode, and waveform measurement mode. This makes it easy to observe waveforms while varying test conditions, such as changing the signal's amplitude and frequency and programming various waveforms to output in order.

Output recorded waveforms without modification

For example, you could output actual waveforms recorded from a car without modification, and then use them for standalone testing. You can also generate isolated output of up to 15 V without a generator or amplifier, which is traditionally necessary in order to generate output while varying the signal's amplitude and frequency.

Process actual waveforms for reproducibility testing

Process and calculate signals recorded with the MEMORY HiCORDER and output the arbitrary waveforms that you create.

Output waveform example

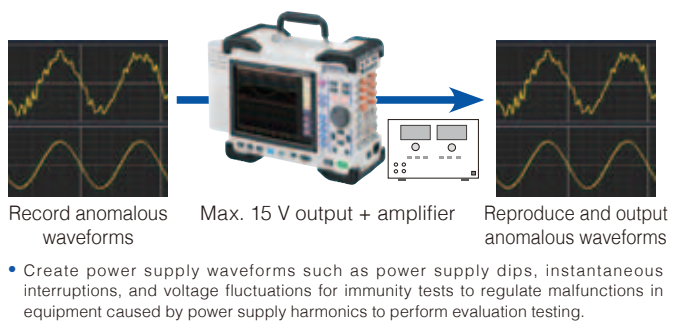

Waveform Maker Software included

After you install the included SF8000 Waveform Maker software on your computer, you can create waveforms easily by either entering them directly or by entering the functions behind them. You can also quickly add noise and multiply waveforms.

Anomaly Simulation

Reproduce and output the observed waveforms without modification. When resolving problems observed during research or development, you can reproduce such problems for efficient testing.

Definitive analysis of important data

Calculate parameter values from measured waveforms

The MR8847A can perform 24 calculations, including RMS, peak value, and maximum value, from measured waveforms. It can also perform time difference measurements, histogram measurements, phase difference measurements, histogram measurements for HIGH level and LOW level, and statistical processing. Calculation results are displayed together on the waveform observation screen.

Process waveforms with formulas

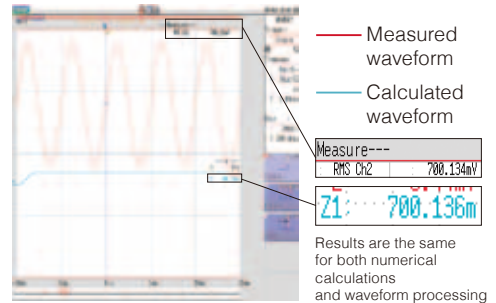

If you know the required formulas, you can also perform complicated calculations. By entering formulas, you can perform a variety of calculations even after measurements are complete. For example, you can make the settings shown on the right to find the RMS value from a measured waveform.

$$RMS = \sqrt{\frac{1}{n} \sum_{i=1}^n d_i^2}$$

RMS = RMS value
 n = Data number
 di = Data for channel i

```
Z1 = SQR(MOV(CH2*CH2,500))
```

Enter formula

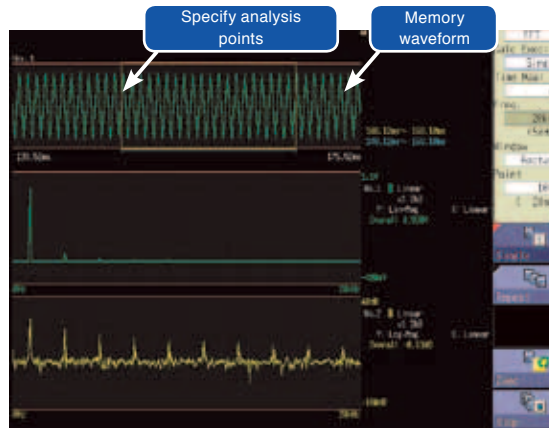

FFT analysis function

The MR8847A can perform one-signal FFT for analyzing frequency components, two-signal FFT for analyzing transfer functions, and octave analysis for acoustics.

FFT calculations from memory waveforms

When performing FFT analysis of data measured with the memory function, you can use the jog shuttle to specify analysis points while also viewing the calculation results at the same time. You can also display both the raw data measured with the memory function and the calculation results for storage waveforms at the same time, which improves operability during analysis by displaying spectrum waveforms while checking the results of window functions.

Display the calculation source (memory waveform) and FFT calculation results at the same time

Running spectrum display

Display the spectrum as it changes over time in 3D

Change the number of calculation points after measurement

Scaling by "dB"

X-Y RECORDER

Now even easier to use with independent pen up/down control. Saving data in chronological order allows records to be saved as digital data, rather than paper hardcopies that need to be stored.

Pen up/down control

Pen up/down during X-Y recording is controlled independently. Press the function button or use an external control terminal (EXT. IN 1, 2, 3) for external control.

Replaces mechanical pen recorders

Use pen up/down control to record only the required data. This allows you to reduce the amount of unnecessary data that is recorded, and lower the running cost for paper.

Pen up/down while recording X-Y waveforms

Control terminals

Determine waveform quality

Use the waveform judgment function, which monitors whether a waveform extends beyond the given area, to easily determine the quality of signal waveforms that are normally difficult to judge.

For time axis ranges that are slower than 100 msec/div, you can even make judgments while loading waveforms. This allows you to take the appropriate action the moment a poor waveform is detected on the production line. You can stop the line as soon as an abnormality is detected.

Judge FFT analysis waveforms

Judge FFT analysis waveforms in the same way.

Judge X-Y waveforms

In addition to time axis signals, the MR8847A also has a waveform judgment function for X-Y waveforms built in. Use this to detect:

- Displacement and pressure of presses
- Pressure and flow rate of pumps

The X-Y waveforms of the above and other data can be tested automatically based on area judgment.

Judge waveform quality by area

Judgment: Poor

Up to 1000 A (High precision) *ME15W (12-pin) terminal type

*The separately available Conversion Cable CT9900 is required in order to use a high-precision current sensor equipped with a ME15W (12-pin) terminal (-05 type) with the Current Measuring Module 8971 (which is designed for use with the MR8847, MR8827, and MR8740).
*While the CT9555 is not required in order to use a sensor equipped with a PL23 (10-pin) terminal with the 8971 or 8940, the Conversion Cable 9318 (which comes with the 8971) is required for that setup.

Direct connectable with the Current Sensor
CURRENT UNIT 8971 For the MR8847, MR8827, MR8740
CONVERSION CABLE 9318 For the CT6841/43 or other

ME15W (12-pin) - PL23 (10-pin) conversion
CONVERSION CABLE CT9901
Convert ME15W (12-pin) terminal to PL23 (10-pin) terminal

Precautions when connecting a high-precision current sensor to a Memory HiCorder Connecting to the MR8847A / MR8827 / MR8740

- High-precision current sensor (ME15W) + CT9901 + 9318 + CURRENT UNIT 8971
- High-precision current sensor (ME15W) + CT9555 + BNC cable \rightarrow except CURRENT UNIT 8971
- High-precision current sensor (PL23) + 9318 \rightarrow CURRENT UNIT 8971
- High-precision current sensor (PL23) + CT9900 + CT9555 + BNC cable \rightarrow except CURRENT UNIT 8971

Other current sensor types
The Memory HiCorder can be used with various types of current sensors and probes. For details, see product information on Hioki's website.

Example sets

8 ch waveform output

8 ch voltage measurement

Anomaly simulation testing

Output measured anomalous waveforms and processed arbitrary waveforms at max. 15 V, and record the results without modification.

Set example

MEMORY HiCORDER	MR8847-51	1 unit
ARBITRARY WAVEFORM GENERATOR UNIT	U8793	4
ANALOG UNIT	8966	4
CONNECTION CABLE	L9795-01	8
CONNECTION CORD	L9198	8

Reproduce anomalous waveforms
Record results while testing

Output both measured anomalous waveforms and waveforms that you created yourself for testing. You can also measure the results at the same time.

Arbitrary waveforms generated for 8 units,
max. 16 channels
Isolated output for all channels

Channels can be expanded without connecting additional recorders. Isolation between the Memory HiCorder and each channel and between the channels allows connections with devices with different potentials.

3 ch voltage measurement

3 ch current measurement

High-voltage direct input measurement

Direct input is also possible without a differential probe for high voltage of 1000 V DC and 700 V AC.

Set example

MEMORY HiCORDER	MR8847-51	1 unit
HIGH-VOLTAGE UNIT	U8974	2
CURRENT UNIT	8971	2
CLAMP ON SENSOR	9272-10	3
CONNECTION CABLE	L4940	3
ALLIGATOR CLIP	L4935	3

No DIFFERENTIAL PROBE
needed for direct high-voltage
measurements

Perform direct measurement of up to 1000 V DC and 700 V AC for high-voltage power equipment as well as 380 V and 480 V systems used globally.

Test ECUs, inverters and motors.

Video recording

Multi-type multi-channel measurement

Simultaneous measurement with high-speed camera recording

Synchronize high-speed video with multi-channel signals for recording.

Visualize prototype evaluations and problem analyses together with measurement data.

Easily visualize the relationship between various factors through the simultaneous measurement of data such as multi-system voltage, current and vibration together with high-speed camera recording.

* Please contact your local Hioki distributor for more information about the use of high-speed cameras.
