1 Real-Time Saving to SD Card in High Resolution

Collect physical signals at a 500 kS/s sampling rate with a high resolution of 25,000 points f.s.

The same working principle as that of a digital oscilloscope is used to record data to the large-capacity internal memory at high speed. The sampling rate is 500 kS/s (2 µs period) on all channels simultaneously. Sensor signal waveforms are recorded and represented faithfully. Furthermore, a 16-bit A/D resolution ensures even subtle changes in the sensor signals are not missed.

■ Maximum time to record to the internal storage memory (Abridged)

* The maximum number of channels to be used is 16 because memory for recording to the internal memory is allocated to each input module.
* Built-in logic, and pulses P1 and P2 each use the capacity equivalent to one analog channel.

* The recording interval is limited depending on the number of measurement ON channels.
* Built-in logic, pulses P1 and P2 each use the capacity equivalent to one analog channel.

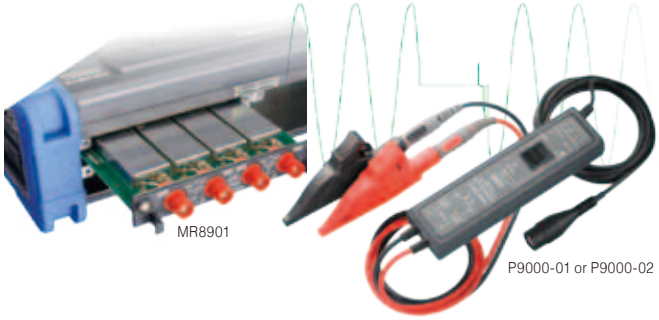
2 Multichannel
Mixed Measurement of Various Signals

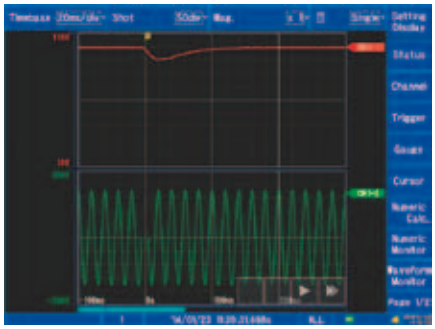
Install input modules according to your specific needs

- The **MR8875** uses a plugin unit-type input amp setup that allows users to select the input unit that's appropriate for their measurement objective. In addition, it's easy to change input units after purchase.
- The Analog Unit **MR8905**, which can accommodate high voltages and which allows direct input of up to 1,000 V (CAT II) or 600 V (CAT III), is available for high-voltage applications. In addition to instantaneous waveforms, measurement of RMS level waveforms is also supported (starting with Ver. 2.14/3.14 of the **MR8875**).
- Even the standard input unit supports 1,000 V (CAT III) measurement if used with the newly developed Differential Probe P9000 series of small probes.
- For high-sensitivity measurement, use the Strain Unit **MR8903**, which features 1 mV f.s. operation (for a maximum resolution of 0.04 µV). Measurement of minuscule sensor output is also supported.

The Analog Unit MR8905 does not include input cables. Separate purchase of the optional Connection Cable Set L4940 (× 2) and Alligator Clip Set L4935 (× 2), which consists of clips that fit onto the ends of the cables, is required.



The Differential Probe P9000 can be used with the standard Analog Unit MR8901 to enable high-voltage, 1,000 V (CAT III) measurement. The P9000-02 further enables RMS level measurement of AC power lines.



• Example of instrument recording the instantaneous waveform and RMS level waveform during a momentary outage of an AC power supply (using the MR8905)

Recorder accepts direct pulse input or standard logic probe terminals

The **MR8875** offers two standard pulse input channels that allow for inputting no-voltage a- and b-contacts, open collector, or voltage. Signals transmitted as pulses, such as those of rotation number and flow rate, can be measured or counted. Use a logic probe for the ON/OFF (logic) signal waveforms of a relay and PLC. Two types of logic probes are available depending on the signal format.

• Multi-channel timing measurement using logic waveform measurement

■ Support for a wide variety of measurement items

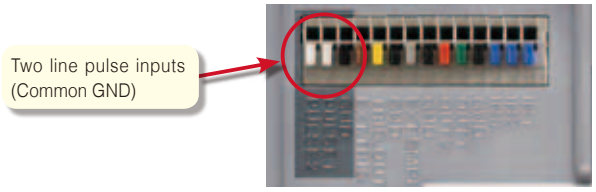
(Model MR8875 ships standard with pulse input capability. Logic input requires optional logic probe.)

Measurement target	Input unit	Measurement range	Resolution	Sampling	Frequency characteristics
Rotation	Standardly equipped with pulse input	5000 (r/s) f.s.	1 (r/s)	10 msec (100 S/s)	N/A
Pulse totalization	Standardly equipped with pulse input	65,535 to 3,276,750,000 counts f.s.	1 count	N/A	N/A
Relay contacts, voltage on/off	Logic Probe 9320-01	Depends on logic probe in use * Max. input 50 V, threshold +1.4/ +2.5/ +4.0 V * Non-voltage contact, short/open	N/A	2 µsec (500 kS/s)	500 nsec or lower response
AC/DC voltage on/off	Logic Probe MR9321-01	Depends on logic probe in use * Detect presence of AC/DC voltages of up to 250 V.	N/A	2 µsec (500 kS/s)	3 msec or lower response

Note: Power line frequency, duty ratio and pulse width measurements are not supported.

■ Pulse input terminal

Take advantage of the frequency dividing function, settable from 1 to 50,000 counts, to take direct readings from an encoder that outputs multi-point pulses according to the rotation number.



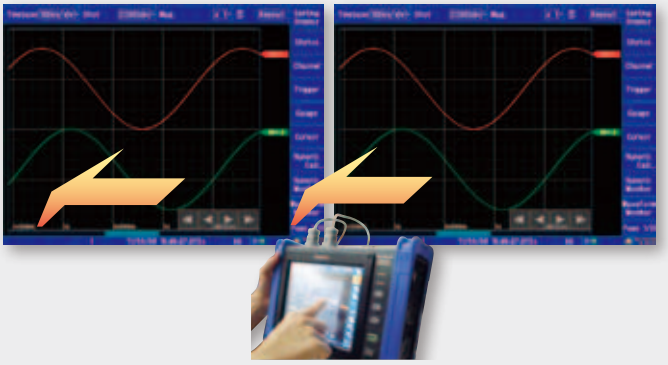
3 Touch Screen for Intuitive Operation

Touch screen interface improves operating efficiency

Buttons on the MR8875 are kept to a minimum by utilizing touch screen technology. The high-definition 8.4-inch high-brightness TFT color LCD is the interface of choice for improving productivity by offering a more intuitive experience than traditional input methods.
While the connection terminals are located at the top panel of the MR8875, when cables need to be connected from the bottom, simply swipe the screen from top to bottom at either edge and the screen will rotate correspondingly. The MR8875 can be set in a position that is easier to use according to the installation location.

Touch to scroll back or scale the waveform

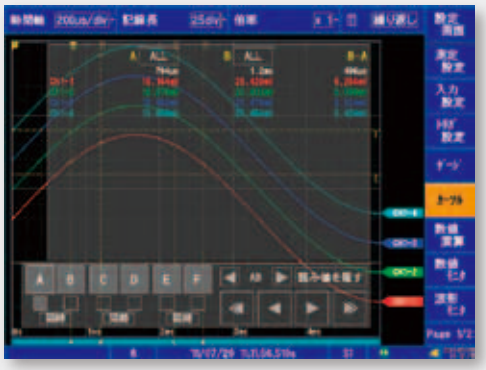
Display earlier waveforms during recording without stopping measurement by simply touching the scroll icons on the screen. You can also scale the waveform amplitude by just swiping through the waveform up (to zoom in) or down (to zoom out).



Advanced cursor read function for multichannel analysis

Six cursors A, B, C, D, E, and F are available, compared with the conventional A- and B-cursors.
Use the cursors to measure and display the following:

- A, B, C, and D: Potential and time from the trigger
- E and F: Potential
- A-B and C-D cursors: Time difference and potential difference
- E-F cursors: Potential



Split screen, sheet display, event mark input, and jump functions indispensable for efficient analysis

Split screen and sheet display functions are provided to support multiple channels. Individual display formats can be selected and an application can be assigned to each sheet for analysis, increasing productivity.

★ For long-term recordings, tag important points with event markers. Up to 1000 markers can be placed so that you can quickly jump to them later for detailed analysis.

5 Powerful Data Analysis Capabilities

FFT Analysis Function

MR8875 Ver. 2.01 or later

Simultaneously measure four phenomena

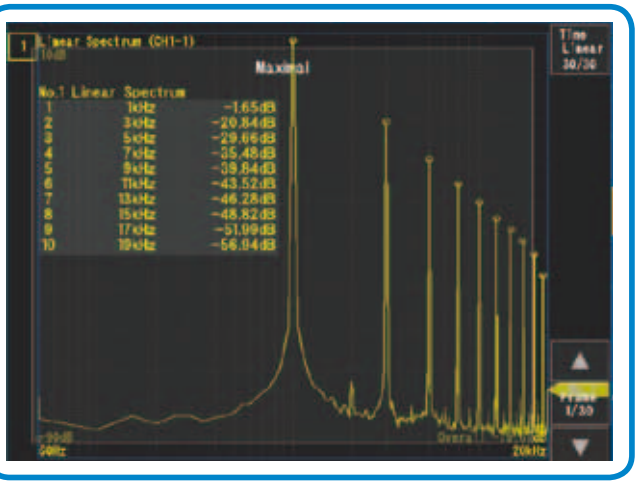
The MR8875's FFT analysis function can simultaneously analyze four phenomena with a single measurement.

By performing FFT analysis of different signal inputs from channels 1 through 4, it is possible to analyze the frequency components of each channel occurring at the same time.

Additionally, you can simultaneously view the linear spectrum, RMS spectrum, power spectrum, and phase spectrum for a signal input to channel 1, for example.

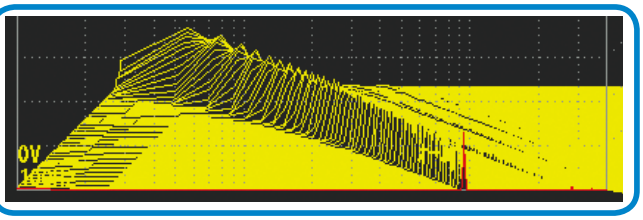
Analysis functionality for a variety of measurement scenarios

The MR8875 features calculation functions that are often used during field measurements. The linear spectrum is used in analysis that focuses on waveform amplitude values, while the power spectrum is used in analysis that focuses on energy, for example noise and vibration measurement. You can select the calculation function that best suits your application— for example, use a transfer function for measurement that identifies internal systems based on I/O characteristics.



Peak value display function (marker display)

The peak value display function can be used to search for maximum and local maximum values and then display them. Characteristic values can be easily displayed even without using a cursor. Since the MR8875 stores up to 200 frames (200 calculation results) of data, it will automatically search for the peak value again if a different frame is selected.

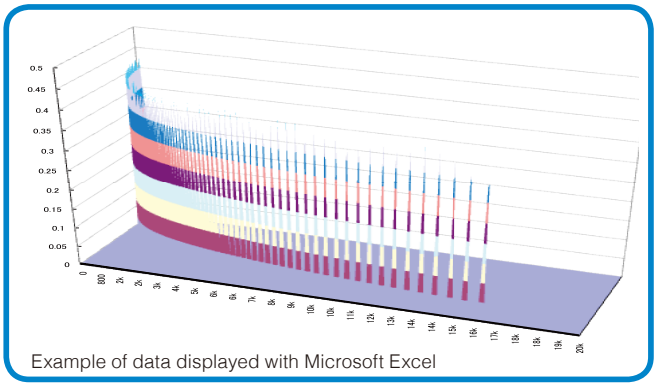


Running spectrum display function

The MR8875's running spectrum display function can be used to continuously display spectra that change over time. Up to 200 frames* of the most recent calculation results can be stored. Although Hioki's MR8847 Series only supports running spectrum display for certain types of calculations, the MR8875 can generate this display with all FFT calculation functions. Additionally, if the selected frame is changed, the cursor value can also be loaded.

** Frame data is stored in the instrument's internal memory, regardless of whether the running spectrum display is used.*

The MR8875 can also freeze the spectrum display on its screen during measurement. This function allows data to be observed without the inclusion of unneeded information on the screen or in the data. All calculation results can be output as CSV data, which can be loaded into a spreadsheet application such as Microsoft Excel and used to create a three-dimensional graph.



Example of data displayed with Microsoft Excel

Extensive window functions

The MR8875 provides a total of seven window functions, including rectangular and Hanning variants. The rectangular function is used for analysis that focuses on spectrum amplitude values, while the Hanning function is used for analysis that focuses on the degree of spectral separation of frequency components. Additionally, by using an exponential window in impact measurement utilizing an impulse hammer, the instrument enables more precise analysis by limiting unneeded noise components on the time axis.

Continuous calculation function

When analyzing a signal that changes over time, the number of FFT calculation points becomes a limitation, preventing the waveform from being analyzed in all time domains. Furthermore, using too many FFT points prevents the desired results from being obtained because the spectrum is averaged. The MR8875 resolves these problems with its continuous calculation function. For data covering extended periods of time, calculation points can be shifted by a number of skip points* at a uniform interval. Moreover, calculations for up to 200 frames can be accomplished with a single operation. Calculation results for different time periods can be reviewed by changing the calculation frame, regardless of whether you're using the running spectrum display or a single-screen display.

** The number of skip points can be set from 100 to 10,000.*

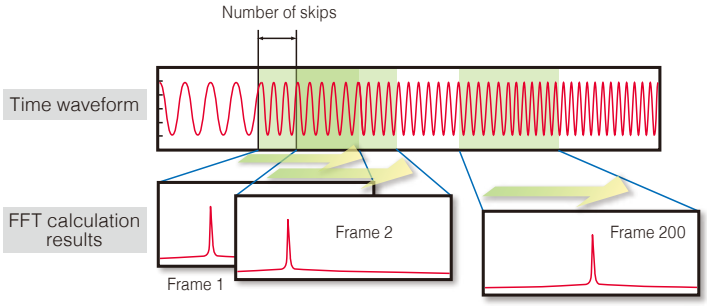


Illustration of continuous calculation

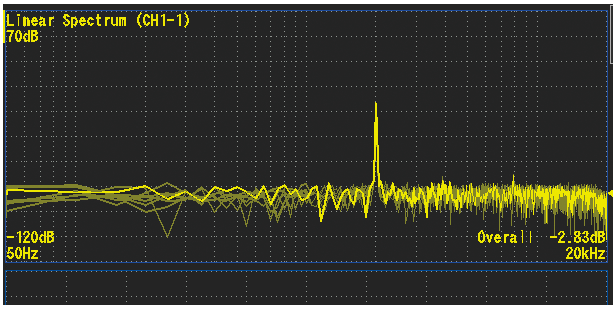
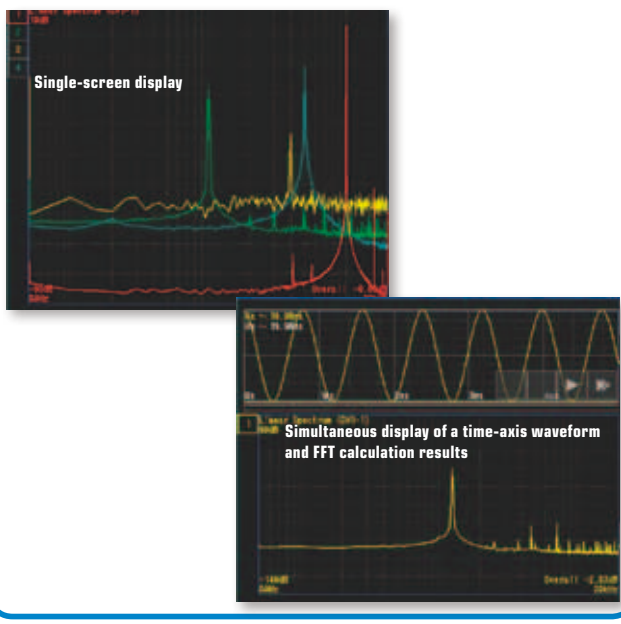
Overlay display function

The MR8875's overlay display function can be used to observe variations in waveforms captured using continuous measurement over time. Although previous Hioki models have not been able to overlay FFT calculations, the MR8875 offers this capability, improving the visibility of analysis.



Visually appealing screen displays

The MR8875's display can be switched according to the application at hand. For example, its single-screen display can be used when focusing on the correlation between channels, while its four-screen display can be used to isolate complex spectra for viewing. Additionally, time and spectrum waveforms can be displayed above and below one another when focusing on correlation with a captured time waveform.



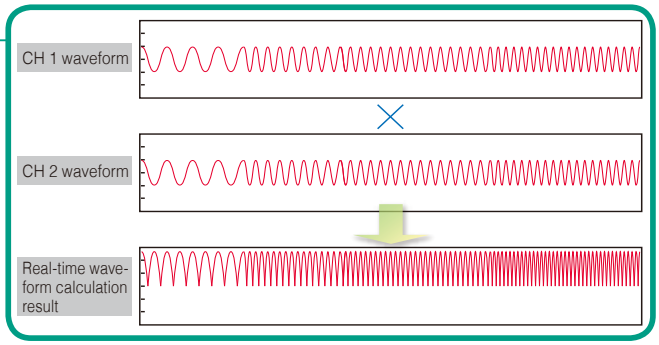
Waveform Calculation Function

MR8875 Ver. 2.01 or later

Real-time inter-channel calculation

The MR8875 features a new real-time inter-channel calculation* function that allows you to observe and record results for up to two calculations on the same input module while measurement continues.

** Between channels on the same input module only (supported input modules: MR8901/8902/8903).*
** Calculations between different modes on the MR8902/8903 (voltage and temperature, etc.) are not supported.*



Waveform-dimension calculations

The previous MR8875 firmware version only supported calculations that generated values such as averages and RMS values, but the new version can process for up to eight calculations simultaneously, including the four arithmetic operations as well as differential-integral and other waveform-dimension calculations.

Digital filter calculations

The MR8875 offers new digital filter calculations* as part of its selection of waveform processing calculations, allowing the necessary bandwidth portion of a waveform containing noise to be calculated and the resulting waveform displayed.

** Finite impulse response (FIR) and infinite impulse response (IIR) digital filters are offered. LPF (passing only the low-frequency component), HPF (passing only the high-frequency component), BPF, and BEF (passing or rejecting only a frequency bandwidth of a certain width) variants of each can be configured.*
** Although FIR calculation processing is time-consuming, it can yield waveforms with no phase distortion. By contrast, IIR calculation yields results at a relatively faster calculation speed but is prone to phase distortion. Each filter's cutoff frequency is use-specified.*

Results of a calculation-based simulation of a waveform from which high-frequency distortion has been rejected by passing it through a low-pass filter.

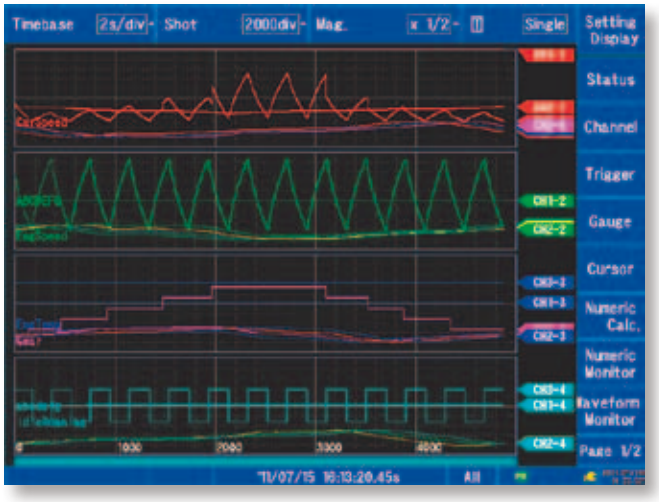
7 CAN Signal Input for Vehicle Testing

Synchronized mixed recording of CAN data and real data such as voltage, temperature, or distortion signals

CAN bus signals that are used widely, particularly in automotive applications, can be recorded, analyzed, converted to analog waveforms, and viewed. Simultaneous recording and viewing of analog waveforms from sensors, in addition to the CAN data, allows you to check the impact of noise and level changes on the communication data.



Vector's CAN database can be loaded using supplied software

Industry standard CANdb® database files can be loaded into the supplied setting software and associated to the CAN channel signals. CAN messages can be viewed using the customer-specified message and signal names, as well as scaled engineering units. Since parameters such as signal data type, start bit, length, and byte sequence are all pre-defined in CANdb, users can concentrate on their measurement tasks without needing to define signals.

CAN editor (bundled software)

Withstand extreme environmental temperatures, vibrations, and data loss due to power outages

In road tests, extreme environmental conditions associated with the temperature and vibration are harsh for measuring instruments. The **MR8875** has the wide operating temperature range of -10°C to 50°C and is compliant with the JIS DI1601 standard for vibration resistance performance. It is designed to withstand the harsh conditions for in-vehicle measurement.

In the event of a power outage while data is being recorded, the power supply is maintained using a built-in large-capacity capacitor until data is completely written to the SD or USB memory. Risk of data loss or damage to the file system is minimized, and after power is restored, measurement can be restarted automatically.
