# 1 Introduction

## 1.1 Welcome

The **PicoScope 4000 Series** of PC Oscilloscopes from Pico Technology is a range of compact, high-resolution scope units designed to replace traditional bench-top oscilloscopes.

This manual explains how to use the Application Programming Interface (API) for the PicoScope 4000 Series scopes. For more information on the hardware, see the [PicoScope 4000 Series User's Guide](#) available as a separate manual.

## 1.2 Software licence conditions

The material contained in this release is licensed, not sold. Pico Technology Limited grants a licence to the person who installs this software, subject to the conditions listed below.

**Access.** The licensee agrees to allow access to this software only to persons who have been informed of these conditions and agree to abide by them.

**Usage.** The software in this release is for use only with Pico products or with data collected using Pico products.

**Copyright.** Pico Technology Ltd. claims the copyright of, and retains the rights to, all material (software, documents, etc.) contained in this SDK except the example programs. You may copy and distribute the SDK without restriction, as long as you do not remove any Pico Technology copyright statements. The example programs in the SDK may be modified, copied and distributed for the purpose of developing programs to collect data using Pico products.

**Liability.** Pico Technology and its agents shall not be liable for any loss, damage or injury, howsoever caused, related to the use of Pico Technology equipment or software, unless excluded by statute.

**Fitness for purpose.** As no two applications are the same, Pico Technology cannot guarantee that its equipment or software is suitable for a given application. It is your responsibility, therefore, to ensure that the product is suitable for your application.

**Mission-critical applications.** This software is intended for use on a computer that may be running other software products. For this reason, one of the conditions of the licence is that it excludes use in mission-critical applications, for example life support systems.

**Viruses.** This software was continuously monitored for viruses during production, but you are responsible for virus-checking the software once it is installed.

**Support.** If you are dissatisfied with the performance of this software, please contact our technical support staff, who will try to fix the problem within a reasonable time. If you are still dissatisfied, please return the product and software to your supplier within 28 days of purchase for a full refund.

**Upgrades.** We provide upgrades, free of charge, from our web site at [www.picotech.com](http://www.picotech.com). We reserve the right to charge for updates or replacements sent out on physical media.

### 1.3 Trademarks

**Windows, Excel** and **Visual Basic** are registered trademarks or trademarks of Microsoft Corporation in the USA and other countries. **LabVIEW** is a registered trademark of National Instruments Corporation.

**Pico Technology** and **PicoScope** are trademarks of Pico Technology Limited, registered in the United Kingdom and other countries.

**Pico Technology** and **PicoScope** are registered in the U.S. Patent and Trademark Office.

### 1.4 Company details

**Address:** Pico Technology  
James House  
Colmworth Business Park  
St Neots  
Cambridgeshire

## 2 Product information

### 2.1 System requirements

#### Using with PicoScope for Windows

To ensure that your [PicoScope 4000 Series](#) PC Oscilloscope operates correctly with the [PicoScope](#) software, you must have a computer with at least the minimum system requirements to run one of the supported operating systems, as shown in the following table. The performance of the oscilloscope will be better with a more powerful PC. Please note the PicoScope software is not installed as part of the SDK.

Item	Specification
Operating system	Windows XP SP3, Vista, 7 or 8 32 bit and 64 bit versions supported
Processor	As required by Windows
Memory	
Free disk space	
Ports	USB 2.0 compliant port (recommended) USB 1.1 compliant port (not recommended)

#### Using with custom applications

Drivers are available for the operating systems mentioned above.

## 2.2 Installation instructions

**IMPORTANT**  
**Do not connect your [PicoScope 4000 Series](#) scope device to the PC before you have installed the Pico Technology software. If you do, Windows might not recognise the scope device correctly.**

### Procedure

- Follow the instructions in the Installation Guide included with your product package.
- Connect your PC Oscilloscope to the PC using the USB cable supplied.

### Checking the installation

Once you have installed the software and connected the PC Oscilloscope to the PC, start the [PicoScope](#) software. PicoScope should now display any signal connected to the scope inputs. If a probe is connected to your oscilloscope, you should see a small 50 or 60 hertz signal in the oscilloscope window when you touch the probe tip with your finger.

### Moving your PicoScope PC Oscilloscope to another USB port

#### ● Windows XP SP3

When you first installed the PicoScope 4000 Series PC Oscilloscope by plugging it into a [USB](#) port, Windows associated the Pico [driver](#) with that port. If you later move the oscilloscope to a different USB port, Windows will display the **New Hardware Found Wizard** again. When this occurs, just click **Next** in the wizard to repeat the installation. If Windows gives a warning about Windows Logo Testing, click **Continue Anyway**. As all the software you need is already installed on your computer, there is no need to insert the Pico Software CD again.

#### ● Windows Vista, 7 and 8

The process is automatic. When you move the device from one port to another, Windows displays an **Installing device driver software** message and then a **PicoScope 4000 Series PC Oscilloscope** message. The PC Oscilloscope is then ready for use.

## 3 Programming with the PicoScope 4000 Series

The `ps4000.dll` dynamic link library in your PicoScope installation directory allows you to program a [PicoScope 4000 Series oscilloscope](#) using standard C [function calls](#).

A typical program for capturing data consists of the following steps:

- [Open](#) the scope unit.
- Set up the input channels with the required [voltage ranges](#) and [coupling mode](#).
- Set up [triggering](#).
- Start capturing data. (See [Sampling modes](#), where programming is discussed in more detail).
- Wait until the scope unit is ready.
- Stop capturing data.
- Copy data to a buffer.
- Close the scope unit.

Numerous [sample programs](#) are installed with your PicoScope software. These show how to use the functions of the driver software in each of the modes available.

### 3.1 Driver

Your application will communicate with a PicoScope 4000 API driver called `ps4000.dll`. The driver exports the PicoScope 4000 [function definitions](#) in standard C format, but this does not limit you to programming in C. You can use the API with any programming language that supports standard C calls.

The API driver depends on a kernel driver, `picopp.sys`, which works with 32-bit Windows XP SP2, Windows Vista and Windows 7. For 64-bit versions, the API depends on the `winusb.sys` kernel driver. Your application does not need to call the kernel driver. Once you have installed the PicoScope 6 software, Windows automatically installs the kernel driver when you plug in the [PicoScope 4000 Series](#) PC Oscilloscope for the first time.

### 3.2 System requirements

#### **General requirements**

See [System Requirements](#).

#### **USB**

The PicoScope 4000 driver offers [three different methods](#) of recording data, all of which support both USB 1.1 and USB 2.0, although the fastest transfer rates between the PC and the PicoScope 4000 are achieved using USB 2.0.

### 3.3 Voltage ranges

The [ps4000SetChannel](#) function allows you to set the voltage range of each input channel of the scope. Each device in the PicoScope 4000 Series has its own set of voltage ranges described in its data sheet. Each sample is normalized to 16 bits resulting in values returned to your application as follows:

Constant	Voltage	Value returned	
		decimal	hex
<a href="#">PS4000_MAX_VALUE</a> or <a href="#">PS4262_MAX_VALUE</a>	maximum	32 764	7FFC
		32 767	7FFF
N/A	zero	0	0000
<a href="#">PS4000_MIN_VALUE</a> or <a href="#">PS4262_MIN_VALUE</a>	minimum	-32 764	8004
		-32 767	8001
<a href="#">PS4000_LOST_DATA</a>	Note 1	-32 768	8000

1. In [streaming mode](#), this special value indicates a buffer overrun.

### 3.4 Channel selection

You can switch each channel on and off, and set its coupling mode to either AC or DC, using the [ps4000SetChannel](#) function.

- **DC coupling:** The scope accepts all input frequencies from zero (DC) up to its maximum analogue bandwidth.
- **AC coupling:** The scope accepts input frequencies from a few hertz up to its maximum analogue bandwidth. The lower -3 dB cutoff frequency is about 1 hertz.

### 3.5 Triggering

PicoScope 4000 Series PC Oscilloscopes can either start collecting data immediately, or be programmed to wait for a **trigger** event to occur. In both cases you need to use the three PicoScope 4000 trigger functions. These can be run collectively by calling [ps4000SetSimpleTrigger](#), or singularly:

- [ps4000SetTriggerChannelConditions](#)
- [ps4000SetTriggerChannelDirections](#)
- [ps4000SetTriggerChannelProperties](#)

A trigger event can occur when one of the signal or trigger input channels crosses a threshold voltage on either a rising or a falling edge.

The driver supports these triggering methods:

- Simple Edge
- Advanced Edge
- Windowing
- Pulse width
- Logic
- Delay
- Drop-out
- Runt

### 3.6 Sampling modes

[PicoScope 4000 Series PC Oscilloscopes](#) can run in various **sampling modes**.

- **Block mode**. In this mode, the scope stores data in its buffer memory and then transfers it to the PC. When the data has been collected it is possible to examine the data, with an optional [aggregation](#) factor. The data is lost when a new run is started in the same [segment](#), the settings are changed, or the scope is powered down.
- **Rapid block mode**. This is a variant of block mode that allows you to capture more than one waveform at a time with a minimum of delay between captures. You can use [aggregation](#) in this mode if you wish.
- **Streaming mode**. In this mode, data is passed directly to the PC without being stored in the scope's buffer memory. This enables long periods of slow data collection for chart recorder and data-logging applications. Streaming mode provides fast streaming at up to 6.6 MS/s (150 ns per sample). Aggregation and triggering are supported in this mode.

In all sampling modes, the driver returns data asynchronously using a [callback](#). This is a call to one of the functions in your own application. When you request data from the scope, you pass to the driver a pointer to your callback function. When the driver has written the data to your buffer, it makes a *callback* (calls your function) to signal that the data is ready. The callback function then signals to the application that the data is available.

Because the callback is called asynchronously from the rest of your application, in a separate thread, you must ensure that it does not corrupt any global variables while it runs.

In block mode, you can also poll the driver instead of using a callback.

### 3.6.1 Block mode

In **block mode**, the computer prompts a [PicoScope 4000 Series](#) PC Oscilloscope to collect a block of data into its internal memory. When the oscilloscope has collected the whole block, it signals that it is ready and then transfers the whole block to the computer's memory through the USB port.

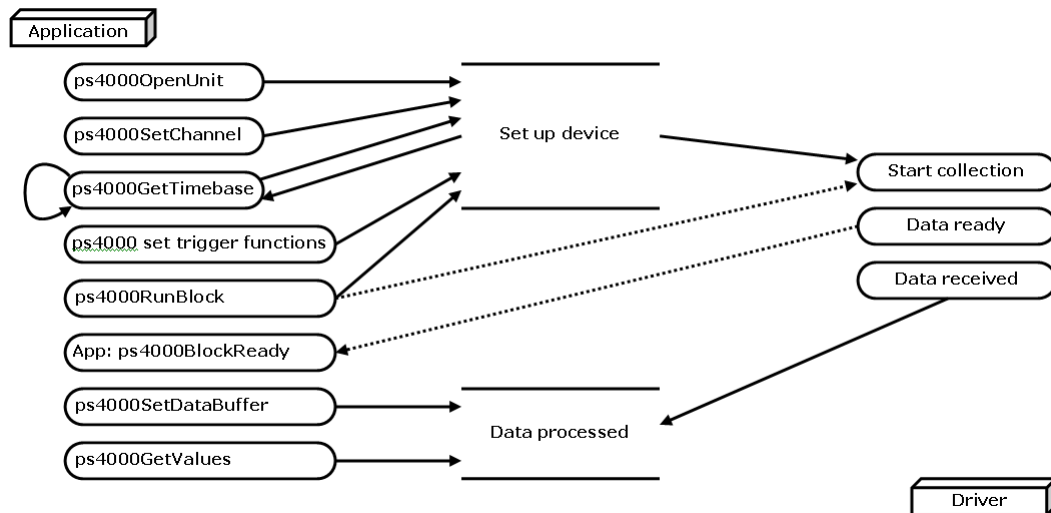

- **Block size.** The maximum number of values depends upon the size of the oscilloscope's memory. The memory buffer is shared between the enabled channels, so if two channels are enabled, each receives half the memory. These features are handled transparently by the driver. The block size also depends on the number of memory segments in use (see [ps4000MemorySegments](#)).
- **Sampling rate.** The PicoScope 4000 Series PC Oscilloscopes can sample at a number of different rates according to their model, selected [timebase](#) and the combination of channels that are enabled. The maximum sampling rate can be achieved with a single channel enabled, or with these two-channel combinations: AC, AD, BC and BD. All other combinations limit the maximum sampling rate of scope, as specified in its Data Sheet.
- **Setup time.** The driver normally performs a number of setup operations, which can take up to 50 milliseconds, before collecting each block of data. If you need to collect data with the minimum time interval between blocks, use [rapid block mode](#) and avoid calling setup functions between calls to [ps4000RunBlock](#), [ps4000Stop](#) and [ps4000GetValues](#).
- **Aggregation.** When the data has been collected, you can set an optional [aggregation](#) factor and examine the data. Aggregation is a process that reduces the amount of data by combining adjacent samples using a maximum/minimum algorithm. It is useful for zooming in and out of the data without having to repeatedly transfer the entire contents of the scope's buffer to the PC.
- **Memory segmentation.** The scope's internal memory can be divided into segments so that you can capture several waveforms in succession. Configure this using [ps4000MemorySegments](#).
- **Data retention.** The data is lost when a new run is started in the same segment or the scope is powered down.

See [Using block mode](#) for programming details.

## 3.6.1.1 Using block mode

This is the general procedure for reading and displaying data in [block mode](#) using a single [memory segment](#):

1. Open the oscilloscope using [ps4000OpenUnit](#).
2. Select channel ranges and AC/DC coupling using [ps4000SetChannel](#).
3. Using [ps4000GetTimebase](#), select timebases until the required nanoseconds per sample is located.
4. Use the trigger setup functions [\[1\]](#) [\[2\]](#) [\[3\]](#) to set up the trigger if required.
5. Start the oscilloscope running using [ps4000RunBlock](#).
6. Wait until the oscilloscope is ready using the [ps4000BlockReady](#) callback.
7. Use [ps4000SetDataBuffer](#) to tell the driver where your memory buffer is.
8. Transfer the block of data from the oscilloscope using [ps4000GetValues](#).
9. Display the data.
10. Repeat steps 5 to 9.
11. Stop the oscilloscope using [ps4000Stop](#).

12. Request new views of stored data using different aggregation parameters: see [Retrieving stored data](#).

### 3.6.2 Rapid block mode

In normal [block mode](#), the PicoScope 4000 Series scopes collect one waveform at a time. You start the the device running, wait until all samples are collected by the device, and then download the data to the PC or start another run. There is a time overhead of tens of milliseconds associated with starting a run, causing a gap between waveforms. When you collect data from the device, there is another minimum time overhead which is most noticeable when using a small number of samples.

**Rapid block mode** allows you to sample several waveforms at a time with the minimum time between waveforms. It reduces the gap from milliseconds to about 2.5 microseconds.

See [Using rapid block mode](#) for details.

#### 3.6.2.1 Using rapid block mode

You can use **rapid block mode** with or without [aggregation](#). The following procedure shows you how to use it without aggregation.

##### Without aggregation

1. Open the oscilloscope using [ps4000OpenUnit](#).
2. Select channel ranges and AC/DC coupling using [ps4000SetChannel](#).
3. Using [ps4000GetTimebase](#), select timebases until the required nanoseconds per sample is located.
4. Use the trigger setup functions [\[1\]](#) [\[2\]](#) [\[3\]](#) to set up the trigger if required.
5. Set the number of memory segments equal to or greater than the number of captures required using [ps4000MemorySegments](#). Use [ps4000SetNoOfCaptures](#) before each run to specify the number of waveforms to capture.
6. Start the oscilloscope running using [ps4000RunBlock](#).
7. Wait until the oscilloscope is ready using the [ps4000BlockReady](#) callback.
8. Use [ps4000SetDataBufferBulk](#) to tell the driver where your memory buffers are.
9. Transfer the blocks of data from the oscilloscope using [ps4000GetValuesBulk](#).
10. Retrieve the time offset for each data segment using [ps4000GetValuesTriggerTimeOffsetBulk64](#).
11. Display the data.
12. Repeat steps 6 to 11 if necessary.
13. Stop the oscilloscope using [ps4000Stop](#).

##### With aggregation

To use rapid block mode with aggregation, follow steps 1 to 9 above and then proceed as follows:

- 10a. Call [ps4000SetDataBuffers](#) to set up one pair of buffers for every waveform segment required.
- 11a. Call [ps4000GetValues](#) for each pair of buffers.
- 12a. Retrieve the time offset for each data segment using [ps4000GetTriggerTimeOffset64](#).

Continue from step 13 above.

## 3.6.2.2 Rapid block mode example 1: no aggregation

```
#define MAX_SAMPLES 1000
```

Set up the device up as usual.

- Open the device
- Channels
- Trigger
- Number of memory segments (this should be equal or more than the no of captures required)

```
// set the number of waveforms to 100
ps4000SetNoOfCaptures (handle, 100);

pParameter = false;
ps4000RunBlock
(
    handle,
    0,                //noOfPreTriggerSamples,
    10000,           // noOfPostTriggerSamples,
    1,               // timebase to be used,
    1,               // oversample
    &timeIndisposedMs,
    1,               // oversample
    lpReady,
    &pParameter
);
```

Comment: these variables have been set as an example and can be any valid value. pParameter will be set true by your callback function lpReady.

```
while (!pParameter) Sleep (0);

for (int i = 0; i < 10; i++)
{
    for (int c = PS4000_CHANNEL_A; c <= PS4000_CHANNEL_D; c++)
    {
        ps4000SetDataBufferBulk
        (
            handle,
            c,
            &buffer[c][i],
            MAX_SAMPLES,
            i
        );
    }
}
```

Comments: buffer has been created as a two-dimensional array of pointers to `int16_t`, which will contain 1000 samples as defined by `MAX_SAMPLES`. There are only 10 buffers set, but it is possible to set up to the number of captures you have requested.

```
ps4000GetValuesBulk
(
    handle,
    &noOfSamples, // set to MAX_SAMPLES on entering the function
    10,           // fromSegmentIndex,
    19,           // toSegmentIndex,
    overflow      // an array of size 10 int16_t
)
```

Comments: the number of samples could be up to `noOfPreTriggerSamples + noOfPostTriggerSamples`, the values set in `ps4000RunBlock`. The samples are always returned from the first sample taken, unlike the `ps4000GetValues` function which allows the sample index to be set. This function does not support aggregation. The above segments start at 10 and finish at 19 inclusive. It is possible for the `fromSegmentIndex` to wrap around to the `toSegmentIndex`, by setting the `fromSegmentIndex` to 98 and the `toSegmentIndex` to 7.

```
ps4000GetValuesTriggerTimeOffsetBulk64
(
    handle,
    times,
    timeUnits,
    10,
    19
)
```

Comments: the above segments start at 10 and finish at 19 inclusive. It is possible for the `fromSegmentIndex` to wrap around to the `toSegmentIndex`, if the `fromSegmentIndex` is set to 98 and the `toSegmentIndex` to 7.

## 3.6.2.3 Rapid block mode example 2: using aggregation

```
#define MAX_SAMPLES 1000
```

Set up the device up as usual.

- Open the device
- Channels
- Trigger
- Number of memory segments (this should be equal or more than the no of captures required)

```
// set the number of waveforms to 100
ps4000SetNoOfCaptures (handle, 100);

pParameter = false;
ps4000RunBlock
(
    handle,
    0,                //noOfPreTriggerSamples,
    1000000,         // noOfPostTriggerSamples,
    1,                // timebase to be used,
    1,                // oversample
    &timeIndisposedMs,
    1,                // oversample
    lpReady,
    &pParameter
);
```

Comments: the set-up for running the device is exactly the same whether or not aggregation will be used when you retrieve the samples.

```
for (int c = PS4000_CHANNEL_A; c <= PS4000_CHANNEL_D; c++)
{
    ps4000SetDataBuffers
    (
        handle,
        c,
        &bufferMax[c],
        &bufferMin[c],
        MAX_SAMPLES,
    );
}
```

Comments: since only one waveform will be retrieved at a time, you only need to set up one pair of buffers; one for the maximum samples and one for the minimum samples. Again, the buffer sizes are 1000 samples.

```
for (int segment = 10; segment < 20; segment++)
{
    ps4000GetValues
    (
        handle,
        0,
        &noOfSamples, // set to MAX_SAMPLES on entering
        1000,
        &downSampleRatioMode, //set to RATIO_MODE_AGGREGATE
        index,
        overflow
    );
}
```

```

    );

    ps4000GetTriggerTimeOffset64
    (
        handle,
        &time,
        &timeUnits,
        index
    )
}

```

Comments: each waveform is retrieved one at a time from the driver with an aggregation of 1000.

### 3.6.3 ETS (Equivalent Time Sampling)

Note: ETS mode is not supported by the PicoScope 4262 oscilloscope.

**ETS** is a way of increasing the effective sampling rate of the scope when capturing repetitive signals. It is a modified form of [block mode](#), and is controlled by the [ps4000SetTrigger](#) and [ps4000SetEts](#) functions.

- Overview.** ETS works by capturing several cycles of a repetitive waveform, then combining them to produce a composite waveform that has a higher effective sampling rate than the individual captures. The scope hardware adds a short, variable delay, which is a small fraction of a single sampling interval, between each trigger event and the subsequent sample. This shifts each capture slightly in time so that the samples occur at slightly different times relative to those of the previous capture. The result is a larger set of samples spaced by a small fraction of the original sampling interval. The maximum effective sampling rates that can be achieved with this method are listed in the User's Guide for the scope device.
- Trigger stability.** Because of the high sensitivity of ETS mode to small time differences, the trigger must be set up to provide a stable waveform that varies as little as possible from one capture to the next.
- Callback.** ETS mode returns data to your application using the [ps4000BlockReady](#) callback function.

<b>Applicability</b>	Available in <a href="#">block mode</a> only. Not suitable for one-shot (non-repetitive) signals. <a href="#">Aggregation</a> and <a href="#">oversampling</a> are not supported. <a href="#">Edge-triggering</a> only. <a href="#">Auto trigger delay</a> ( <code>autoTriggerMilliseconds</code> ) is ignored.
----------------------	---

#### 3.6.3.1 Using ETS mode

Since [ETS mode](#) is a type of block mode, the procedure is the same as the one described in [Using block mode](#).

### 3.6.4 Streaming mode

**Streaming mode** can capture data without the gaps that occur between blocks when using [block mode](#). It can transfer data to the PC at speeds of up to 6.6 million samples per second (150 nanoseconds per sample), depending on the computer's performance. This makes it suitable for **high-speed data acquisition**, allowing you to capture long data sets limited only by the computer's memory.

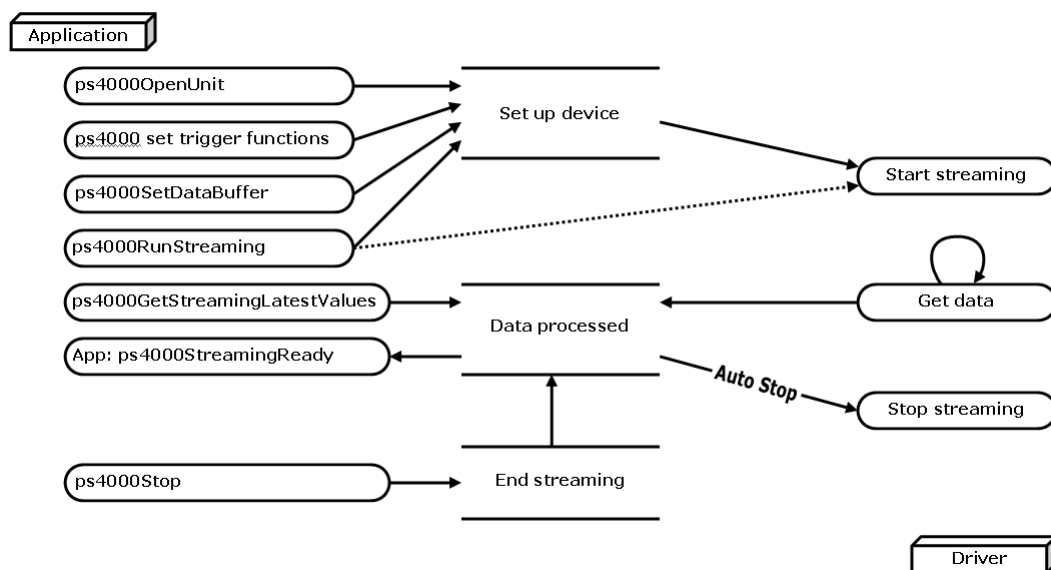

- **Aggregation.** The driver returns [aggregated readings](#) while the device is streaming. If aggregation is set to 1 then only one buffer is returned per channel. When aggregation is set above 1 then two buffers (maximum and minimum) per channel are returned.
- **Memory segmentation.** The memory can be divided into [segments](#) to reduce the latency of data transfers to the PC. However, this increases the risk of losing data if the PC cannot keep up with the device's sampling rate.

See [Using streaming mode](#) for programming details.

#### 3.6.4.1 Using streaming mode

This is the general procedure for reading and displaying data in [streaming mode](#) using a single [memory segment](#):

1. Open the oscilloscope using [ps4000OpenUnit](#).
2. Select channels, ranges and AC/DC coupling using [ps4000SetChannel](#).
3. Use the trigger setup functions [\[1\]](#) [\[2\]](#) [\[3\]](#) to set up the trigger if required.
4. Call [ps4000SetDataBuffer](#) to tell the driver where your data buffer is.
5. Set up aggregation and start the oscilloscope running using [ps4000RunStreaming](#).
6. Call [ps4000GetStreamingLatestValues](#) to get data.
7. Process data returned to your application's function. This example is using Auto Stop, so after the driver has received all the data points requested by the application, it stops the device streaming.
8. Call [ps4000Stop](#), even if Auto Stop is enabled.

9. Request new views of stored data using different aggregation parameters: see [Retrieving stored data](#).

### 3.6.5 Retrieving stored data

You can collect data from the PicoScope 4000 driver with a different aggregation factor when [ps4000RunBlock](#) or [ps4000RunStreaming](#) has already been called and has successfully captured all the data. Use [ps4000GetValuesAsync](#).

## 3.7 Oversampling

When the oscilloscope is operating at sampling rates less than its maximum, it is possible to **oversample**. Oversampling is taking more than one measurement during a time interval and returning the average as one sample. The number of measurements per sample is called the oversampling factor. If the signal contains a small amount of Gaussian noise, this technique can increase the effective [vertical resolution](#) of the oscilloscope by  $n$  bits, where  $n$  is given approximately by the equation below:

$$n = \log(\text{oversampling factor}) / \log 4$$

Conversely, for an improvement in resolution of  $n$  bits, the oversampling factor you need is given approximately by:

$$\text{oversampling factor} = 4^n$$

<b>Applicability</b>	Available in <a href="#">block mode</a> only. Cannot be used at the same time as <a href="#">aggregation</a> .
----------------------	---

### 3.8 Timebases

The API allows you to select one of  $2^{30}$  different timebases related to the maximum sampling rate of the oscilloscope. The timebases allow slow enough sampling in block mode to overlap the streaming sample intervals, so that you can make a smooth transition between block mode and streaming mode.

For all PicoScope 4000 Series scopes except the PicoScope 4262, the range of timebase values is divided into "low" and "high" subranges, with the low sub-range specifying a power of 2 and the high sub-range specifying a fraction of the clock frequency. The PicoScope 4262 has a single range of timebases specifying a power of 2.

Timebase (n)	Sampling interval (t)		
	PicoScope 4223 PicoScope 4224 PicoScope 4423 PicoScope 4424	PicoScope 4226 PicoScope 4227	PicoScope 4262
Low	$2^n / 80,000,000$  n=0: 12.5 ns n=1: 25 ns n=2: 50 ns	$2^n / 250,000,000$  n=0*: 4 ns n=1: 8 ns n=2: 16 ns n=3: 32 ns	$(n+1) / 10,000,000$  n=0: 100 ns n=1: 200 ns n=2: 300 ns ... n= $2^{30}-1$ : ~107 s
High	$(n-1) / 20,000,000$  n=3: 100 ns n=4: 150 ns n=5: 200 ns ... n= $2^{30}-1$ : ~54 s	$(n-2) / 31,250,000$  n=4: 64 ns n=5: 96 ns n=6: 128 ns ... n= $2^{30}-1$ : ~34 s	

\* PicoScope 4227 only

<b>Applicability</b>	Use <a href="#">ps4000GetTimebase</a> API call.
----------------------	---

### 3.9 Combining several oscilloscopes

It is possible to collect data using up to 64 [PicoScope 4000 Series PC Oscilloscopes](#) at the same time, depending on the capabilities of the PC. Each oscilloscope must be connected to a separate USB port. The [ps4000OpenUnit](#) function returns a handle to an oscilloscope. All the other functions require this handle for oscilloscope identification. For example, to collect data from two oscilloscopes at the same time:

```
CALLBACK ps4000BlockReady(...)
// define callback function specific to application

handle1 = ps4000OpenUnit()
handle2 = ps4000OpenUnit()

ps4000SetChannel(handle1)
// set up unit 1
ps4000RunBlock(handle1)

ps4000SetChannel(handle2)
// set up unit 2
ps4000RunBlock(handle2)

// data will be stored in buffers
// and application will be notified using callback

ready = FALSE
while not ready
    ready = handle1_ready
    ready &= handle2_ready
```

**Note:** It is not possible to synchronize the collection of data between oscilloscopes that are being used in combination.

### 3.10 API functions

The PicoScope 4000 Series API exports the following functions for you to use in your own applications. All functions are C functions using the standard call naming convention (`__stdcall`). They are all exported with both decorated and undecorated names.

[ps4000BlockReady](#): receive notification when block-mode data ready  
[ps4000CloseUnit](#): close a scope device  
[ps4000DataReady](#): indicate when post-collection data ready  
[ps4000EnumerateUnits](#): find out how many units are connected  
[ps4000FlashLed](#): flash the front-panel LED  
[ps4000GetChannelInformation](#): find out if extra ranges available  
[ps4000GetMaxDownSampleRatio](#): find out aggregation ratio for data  
[ps4000GetStreamingLatestValues](#): get streaming data while scope is running  
[ps4000GetTimebase](#): find out what timebases are available  
[ps4000GetTimebase2](#): find out what timebases are available  
[ps4000GetTriggerChannelTimeOffset](#): get trigger times from specified channel  
[ps4000GetTriggerChannelTimeOffset64](#): get trigger times from specified channel  
[ps4000GetTriggerTimeOffset](#): find out when trigger occurred (32-bit)  
[ps4000GetTriggerTimeOffset64](#): find out when trigger occurred (64-bit)  
[ps4000GetUnitInfo](#): read information about scope device  
[ps4000GetValues](#): retrieve block-mode data with callback  
[ps4000GetValuesAsync](#): retrieve streaming data with callback  
[ps4000GetValuesBulk](#): retrieve more than one waveform at a time  
[ps4000GetValuesTriggerChannelTimeOffsetBulk](#): retrieve time offset from a channel  
[ps4000GetValuesTriggerChannelTimeOffsetBulk64](#): retrieve time offset (64-bit)  
[ps4000GetValuesTriggerTimeOffsetBulk](#): retrieve time offset for a group of waveforms  
[ps4000GetValuesTriggerTimeOffsetBulk64](#): set the buffers for each waveform (64-bit)  
[ps4000HoldOff](#): set trigger holdoff  
[ps4000IsLedFlashing](#): read status of LED  
[ps4000IsReady](#): poll driver in block mode  
[ps4000IsTriggerOrPulseWidthQualifierEnabled](#): find out whether trigger is enabled  
[ps4000MemorySegments](#): divide scope memory into segments  
[ps4000NoOfStreamingValues](#): get number of samples in streaming mode  
[ps4000OpenUnit](#): open a scope device  
[ps4000OpenUnitAsync](#): open a scope device without waiting  
[ps4000OpenUnitAsyncEx](#): open a specified device without waiting  
[ps4000OpenUnitEx](#): open a specified device  
[ps4000OpenUnitProgress](#): check progress of OpenUnit call  
[ps4000RunBlock](#): start block mode  
[ps4000RunStreaming](#): start streaming mode  
[ps4000RunStreamingEx](#): start streaming mode with a specified data reduction mode  
[ps4000SetChannel](#): set up input channels  
[ps4000SetDataBuffer](#): register data buffer with driver  
[ps4000SetDataBufferBulk](#): set the buffers for each waveform  
[ps4000SetDataBuffers](#): register min/max data buffers with driver  
[ps4000SetDataBuffersWithMode](#): register data buffers and specify aggregation mode  
[ps4000SetDataBufferWithMode](#): register data buffer and specify aggregation mode  
[ps4000SetEts](#): set up equivalent-time sampling (ETS)  
[ps4000SetEtsTimeBuffer](#): set up 64-bit buffer for ETS time data  
[ps4000SetEtsTimeBuffers](#): set up 32-bit buffers for ETS time data  
[ps4000SetExtTriggerRange](#): set EXT trigger input range  
[ps4000SetPulseWidthQualifier](#): set up pulse width triggering  
[ps4000SetSigGenArbitrary](#): set up arbitrary waveform generator  
[ps4000SetSigGenBuiltIn](#): set up function generator  
[ps4000SetSimpleTrigger](#): set up level triggers only  
[ps4000SetTriggerChannelConditions](#): specify which channels to trigger on  
[ps4000SetTriggerChannelDirections](#): set up signal polarities for triggering  
[ps4000SetTriggerChannelProperties](#): set up trigger thresholds  
[ps4000SetTriggerDelay](#): set up post-trigger delay  
[ps4000SigGenSoftwareControl](#): trigger the signal generator  
[ps4000Stop](#): stop data capture  
[ps4000StreamingReady](#): indicate when streaming-mode data ready

## 3.10.1 ps4000BlockReady

```
typedef void (CALLBACK *ps4000BlockReady)
(
    int16_t          handle,
    PICO\_STATUS     status,
    void             * pParameter
)
```

This [callback](#) function is part of your application. You register it with the PicoScope 4000 Series driver using [ps4000RunBlock](#), and the driver calls it back when block-mode data is ready. You can then download the data using the [ps4000GetValues](#) function.

<b>Applicability</b>	<a href="#">Block mode</a> only
<b>Arguments</b>	<p><code>handle</code>, the handle of the device returning the samples.</p> <p><code>status</code>, indicates whether an error occurred during collection of the data.</p> <p><code>pParameter</code>, a void pointer passed from <a href="#">ps4000RunBlock</a>. The callback function can write to this location to send any data, such as a status flag, back to your application.</p>
<b>Returns</b>	nothing

## 3.10.2 ps4000CloseUnit

```
PICO\_STATUS ps4000CloseUnit  
(  
    int16_t handle  
)
```

This function shuts down a PicoScope 4000 scope device.

<b>Applicability</b>	All modes
<b>Arguments</b>	<code>handle</code> , the handle, returned by <a href="#">ps4000OpenUnit</a> , of the scope device to be closed.
<b>Returns</b>	PICO_OK PICO_HANDLE_INVALID

## 3.10.3 ps4000DataReady

```
typedef void (CALLBACK *ps4000DataReady)
(
    int16_t          handle,
    int32_t          noOfSamples,
    int16_t          overflow,
    uint32_t         triggerAt,
    int16_t          triggered,
    void             * pParameter
)
```

This function handles post-collection data returned by the driver after a call to [ps4000GetValuesAsync](#). It is a [callback](#) function that is part of your application. You register it with the PicoScope 4000 Series driver using [ps4000GetValuesAsync](#), and the driver calls it back when the data is ready.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the device returning the samples.</p> <p><code>noOfSamples</code>, the number of samples collected.</p> <p><code>overflow</code>, returns a flag that indicates whether an overvoltage has occurred on any of the channels. It is a bit pattern with bit 0 denoting Channel A and bit 1 Channel B.</p> <p><code>triggerAt</code>, an index to the buffer indicating the location of the trigger point. This parameter is valid only when <code>triggered</code> is non-zero.</p> <p><code>triggered</code>, a flag indicating whether a trigger occurred. If non-zero, a trigger occurred at the location indicated by <code>triggerAt</code>.</p> <p><code>pParameter</code>, a void pointer passed from <a href="#">ps4000GetValuesAsync</a>. The callback function can write to this location to send any data, such as a status flag, back to the application. The data type is defined by the application programmer.</p>
<b>Returns</b>	nothing

## 3.10.4 ps4000EnumerateUnits

```

PICO_STATUS ps4000EnumerateUnits
(
    int16_t * count,
    int8_t * serials,
    int16_t * serialLth
)

```

This function counts the number of PicoScope 4000 units connected to the computer, and returns a list of serial numbers as a string.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p>* <code>count</code>, on exit, the number of scopes found</p> <p>* <code>serials</code>, on exit, a list of serial numbers separated by commas and terminated by a final null. Example: AQ005/139,VDR61/356,ZOR14/107. Can be NULL on entry if serial numbers are not required.</p> <p>* <code>serialLth</code>, on entry, the length of the <code>int8_t</code> buffer pointed to by <code>serials</code>; on exit, the length of the string written to <code>serials</code></p>
<b>Returns</b>	PICO_OK PICO_BUSY PICO_NULL_PARAMETER PICO_FW_FAIL PICO_CONFIG_FAIL PICO_MEMORY_FAIL PICO_ANALOG_BOARD PICO_CONFIG_FAIL_AWG PICO_INITIALISE_FPGA

## 3.10.5 ps4000FlashLed

```

PICO_STATUS ps4000FlashLed
(
    int16_t    handle,
    int16_t    start
)

```

This function flashes the LED on the front of the scope without blocking the calling thread. Calls to [ps4000RunStreaming](#) and [ps4000RunBlock](#) cancel any flashing started by this function.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the scope device</p> <p><code>start</code>, the action required:</p> <ul style="list-style-type: none"> <li>&lt; 0 : flash the LED indefinitely.</li> <li>0 : stop the LED flashing.</li> <li>&gt; 0 : flash the LED <code>start</code> times. If the LED is already flashing on entry to this function, the flash count will be reset to <code>start</code>.</li> </ul>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_HANDLE_INVALID</p> <p>PICO_BUSY</p>

## 3.10.6 ps4000GetChannelInformation

```

PICO\_STATUS ps4000GetChannelInformation
(
    int16_t          handle,
    PS4000\_CHANNEL\_INFO info,
    int32_t          probe,
    int32_t          * ranges,
    int32_t          * length,
    int32_t          channel
)

```

This function queries which extra ranges are available on a scope device.

<b>Applicability</b>	Reserved for future expansion
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>info</code>, the type of information required, chosen from the list of <a href="#">PS4000_CHANNEL_INFO</a> values</p> <p><code>probe</code>, not used, must be set to 0</p> <p><code>ranges</code>, an array that will be populated with available ranges for the given value of <code>info</code>. May be NULL. See <a href="#">PS4000_RANGE</a> for possible values.</p> <p><code>length</code>, on entry: the length of the <code>ranges</code> array; on exit: the number of elements written to <code>ranges</code> or, if <code>ranges</code> is NULL, the number of elements that would have been written.</p> <p><code>channel</code>, the channel for which the information is required. See <a href="#">PS4000_CHANNEL</a> for possible values.</p>
<b>Returns</b>	<a href="#">PICO_OK</a> <a href="#">PICO_INVALID_HANDLE</a> <a href="#">PICO_INVALID_PARAMETER</a>

## 3.10.7 ps4000GetMaxDownSampleRatio

```

PICO_STATUS ps4000GetMaxDownSampleRatio
(
    int16_t          handle,
    uint32_t         noOfUnaggregatedSamples,
    uint32_t         * maxDownSampleRatio,
    int16_t          downSampleRatioMode,
    uint16_t         segmentIndex
)

```

This function returns the maximum downsampling ratio that can be used for a given number of samples.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>noOfUnaggregatedSamples</code>, the number of unaggregated samples to be used to calculate the maximum downsampling ratio</p> <p><code>maxDownSampleRatio</code>, returns the aggregation ratio</p> <p><code>downSampleRatioMode</code>, see <a href="#">ps4000GetValues</a></p> <p><code>segmentIndex</code>, the <a href="#">memory segment</a> where the data is stored</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_NO_SAMPLES_AVAILABLE</p> <p>PICO_NULL_PARAMETER</p> <p>PICO_INVALID_PARAMETER</p> <p>PICO_SEGMENT_OUT_OF_RANGE</p> <p>PICO_TOO_MANY_SAMPLES</p>

## 3.10.8 ps4000GetStreamingLatestValues

```

PICO_STATUS ps4000GetStreamingLatestValues
(
    int16_t          handle,
    ps4000StreamingReady lpPs4000Ready,
    void            * pParameter
)

```

This function is used to collect the next block of values while [streaming](#) is running. You must call [ps4000RunStreaming](#) beforehand to set up streaming.

<b>Applicability</b>	<a href="#">Streaming</a> mode only
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>lpPs4000Ready</code>, a pointer to your <a href="#">ps4000StreamingReady</a> callback function that will return the latest aggregated values.</p> <p><code>pParameter</code>, a void pointer that will be passed to the <a href="#">ps4000StreamingReady</a> callback function.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NO_SAMPLES_AVAILABLE PICO_INVALID_CALL PICO_BUSY PICO_NOT_RESPONDING

## 3.10.9 ps4000GetTimebase

```

PICO_STATUS ps4000GetTimebase
(
    int16_t          handle,
    uint32_t         timebase,
    int32_t          noSamples,
    int32_t          * timeIntervalNanoseconds,
    int16_t         oversample,
    int32_t          * maxSamples
    uint16_t         segmentIndex
)

```

This function discovers which [timebases](#) are available on the oscilloscope. You should set up the channels using [ps4000SetChannel](#) first.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>timebase</code>, a code between 0 and <math>2^{30}-1</math> that specifies the sampling interval (<a href="#">see timebase guide</a>).</p> <p><code>noSamples</code>, the number of samples required. This value is used to calculate the most suitable time unit to use.</p> <p><code>timeIntervalNanoseconds</code>, a pointer to the time interval between readings at the selected timebase. If a null pointer is passed, nothing will be written here.</p> <p><code>oversample</code>, the amount of oversample required. An oversample of 4, for example, would quadruple the time interval and quarter the maximum samples, and at the same time would increase the effective resolution by one bit. See the topic on <a href="#">oversampling</a>.</p> <p><code>maxSamples</code>, a pointer to the maximum number of samples available. The maximum samples may vary depending on the number of channels enabled, the timebase chosen and the oversample selected. If this pointer is null, nothing will be written here.</p> <p><code>segmentIndex</code>, the number of the memory segment to use.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_TOO_MANY_SAMPLES</p> <p>PICO_INVALID_CHANNEL</p> <p>PICO_INVALID_TIMEBASE</p> <p>PICO_INVALID_PARAMETER</p>

## 3.10.10 ps4000GetTimebase2

```

PICO STATUS ps4000GetTimebase2
(
    int16_t          handle,
    uint32_t         timebase,
    int32_t          noSamples,
    float            * timeIntervalNanoseconds,
    int16_t          oversample,
    int32_t          * maxSamples
    uint16_t         segmentIndex
)

```

This function differs from [ps4000GetTimebase](#) only in the `float *` type of the `timeIntervalNanoseconds` argument.

<b>Applicability</b>	All modes
<b>Arguments</b>	<code>timeIntervalNanoseconds</code> , a pointer to the time interval between readings at the selected timebase. If a null pointer is passed, nothing will be written here.  All others as in <a href="#">ps4000GetTimebase</a> .
<b>Returns</b>	See <a href="#">ps4000GetTimebase</a> .

## 3.10.11 ps4000GetTriggerChannelTimeOffset

```

PICO_STATUS ps4000GetTriggerChannelTimeOffset
(
    int16_t          handle,
    uint32_t         * timeUpper,
    uint32_t         * timeLower,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         segmentIndex,
    PS4000_CHANNEL   channel
)

```

This function gets the time, as two 4-byte values, at which the trigger occurred, adjusted for the time skew of the specified channel relative to the trigger source. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture.

<b>Applicability</b>	<a href="#">Block mode, rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>timeUpper</code>, a pointer to the upper 32 bits of the time at which the trigger point occurred</p> <p><code>timeLower</code>, a pointer to the lower 32 bits of the time at which the trigger point occurred</p> <p><code>timeUnits</code>, returns the time units in which <code>timeUpper</code> and <code>timeLower</code> are measured. The allowable values are:</p> <ul style="list-style-type: none"> <li>PS4000_FS: femtoseconds</li> <li>PS4000_PS: picoseconds</li> <li>PS4000_NS: nanoseconds</li> <li>PS4000_US: microseconds</li> <li>PS4000_MS: milliseconds</li> <li>PS4000_S: seconds</li> </ul> <p><code>segmentIndex</code>, the number of the <a href="#">memory segment</a> for which the information is required.</p> <p><code>channel</code>, the scope channel for which the information is required</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_DEVICE_SAMPLING PICO_SEGMENT_OUT_OF_RANGE PICO_NULL_PARAMETER PICO_NO_SAMPLES_AVAILABLE

## 3.10.12 ps4000GetTriggerChannelTimeOffset64

```

PICO_STATUS ps4000GetTriggerChannelTimeOffset64
(
    int16_t          handle,
    int64_t          * time,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         segmentIndex,
    PS4000_CHANNEL  channel
)

```

This function gets the time, as a single 8-byte value, at which the trigger occurred, adjusted for the time skew of the specified channel relative to the trigger source. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture.

<b>Applicability</b>	<a href="#">Block mode, rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>time</code>, a pointer to the time at which the trigger point occurred</p> <p><code>timeUnits</code>, returns the time units in which <code>time</code> is measured. See <a href="#">ps4000GetTriggerChannelTimeOffset</a>.</p> <p><code>segmentIndex</code>, the number of the <a href="#">memory segment</a> for which the information is required</p> <p><code>channel</code>, the scope channel for which the information is required</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_DEVICE_SAMPLING PICO_SEGMENT_OUT_OF_RANGE PICO_NULL_PARAMETER PICO_NO_SAMPLES_AVAILABLE

## 3.10.13 ps4000GetTriggerTimeOffset

```

PICO STATUS ps4000GetTriggerTimeOffset
(
    int16_t          handle
    uint32_t         * timeUpper
    uint32_t         * timeLower
    PS4000 TIME UNITS * timeUnits
    uint16_t         segmentIndex
)

```

This function gets the time, as two 4-byte values, at which the trigger occurred. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture.

<b>Applicability</b>	<a href="#">Block mode, rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>timeUpper</code>, a pointer to the upper 32 bits of the time at which the trigger point occurred</p> <p><code>timeLower</code>, a pointer to the lower 32 bits of the time at which the trigger point occurred</p> <p><code>timeUnits</code>, see <a href="#">ps4000GetTriggerChannelTimeOffset</a>.</p> <p><code>segmentIndex</code>, the number of the <a href="#">memory segment</a> for which the information is required.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_DEVICE_SAMPLING</p> <p>PICO_SEGMENT_OUT_OF_RANGE</p> <p>PICO_NULL_PARAMETER</p> <p>PICO_NO_SAMPLES_AVAILABLE</p>

## 3.10.14 ps4000GetTriggerTimeOffset64

```

PICO_STATUS ps4000GetTriggerTimeOffset64
(
    int16_t          handle,
    int64_t          * time,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         segmentIndex
)

```

This function gets the time, as a single 8-byte value, at which the trigger occurred. Call it after block-mode data has been captured or when data has been retrieved from a previous block-mode capture.

<b>Applicability</b>	<a href="#">Block mode, rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>time</code>, a pointer to the time at which the trigger point occurred</p> <p><code>timeUnits</code>, returns the time units in which <code>time</code> is measured. See <a href="#">ps4000GetTriggerChannelTimeOffset</a>.</p> <p><code>segmentIndex</code>, the number of the <a href="#">memory segment</a> for which the information is required</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_DEVICE_SAMPLING PICO_SEGMENT_OUT_OF_RANGE PICO_NULL_PARAMETER PICO_NO_SAMPLES_AVAILABLE

## 3.10.15 ps4000GetUnitInfo

```

PICO_STATUS ps4000GetUnitInfo
(
    int16_t    handle,
    int8_t     * string,
    int16_t    stringLength,
    int16_t    * requiredSize
    PICO_INFO  info
)

```

This function writes information about the specified scope device to a character string. If the device fails to open, only the driver version and error code are available to explain why the last open unit call failed.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the device from which information is required. If an invalid handle is passed, the error code from the last unit that failed to open is returned.</p> <p><code>string</code>, a pointer to the character string buffer in the calling function where the unit information string (selected with <code>info</code>) will be stored. If a null pointer is passed, only the <code>requiredSize</code>, pointer to an <code>int16_t</code>, of the character string buffer is returned.</p> <p><code>stringLength</code>, used to return the size of the character string buffer.</p> <p><code>requiredSize</code>, used to return the required character string buffer size.</p> <p><code>info</code>, an enumerated type specifying what information is required from the driver.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NULL_PARAMETER PICO_INVALID_INFO PICO_INFO_UNAVAILABLE

PICO_INFO constant	Example
0: PICO_DRIVER_VERSION, version number of PicoScope 4000 DLL	1,0,0,1
1: PICO_USB_VERSION, type of USB connection to device: 1.1 or 2.0	2.0
2: PICO_HARDWARE_VERSION, hardware version of device	1
3: PICO_VARIANT_INFO, variant number of device	4224
4: PICO_BATCH_AND_SERIAL, batch and serial number of device	KJL87/6
5: PICO_CAL_DATE, calibration date of device	11Nov08
6: PICO_KERNEL_VERSION, version of kernel driver	1,1,2,4

## 3.10.16 ps4000GetValues

```

PICO_STATUS ps4000GetValues
(
    int16_t      handle,
    uint32_t     startIndex,
    uint32_t     * noOfSamples,
    uint32_t     downSampleRatio,
    int16_t      downSampleRatioMode,
    uint16_t     segmentIndex,
    int16_t     * overflow
)

```

This function returns block-mode data, either with or without [aggregation](#), starting at the specified sample number. It is used to get the stored data from the scope after data collection has stopped.

<b>Applicability</b>	<a href="#">Block mode</a> , <a href="#">rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>startIndex</code>, a zero-based index that indicates the start point for data collection. It is measured in sample intervals from the start of the buffer.</p> <p><code>noOfSamples</code>, on entry: the number of samples requested; on exit, the number of samples actually returned.</p> <p><code>downSampleRatio</code>, the aggregation factor that will be applied to the raw data.</p> <p><code>downSampleRatioMode</code>, whether to use aggregation to reduce the amount of data. The available values are:  RATIO_MODE_NONE (downSampleRatio is ignored)  RATIO_MODE_AGGREGATE (uses <a href="#">aggregation</a>)</p> <p><code>segmentIndex</code>, the zero-based number of the <a href="#">memory segment</a> where the data is stored.</p> <p><code>overflow</code>, returns a set of flags that indicate whether an overvoltage has occurred on any of the channels. It is a bit pattern with bit 0 denoting Channel A and bit 1 Channel B.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NO_SAMPLES_AVAILABLE PICO_DEVICE_SAMPLING PICO_NULL_PARAMETER PICO_SEGMENT_OUT_OF_RANGE PICO_INVALID_PARAMETER PICO_TOO_MANY_SAMPLES PICO_DATA_NOT_AVAILABLE PICO_STARTINDEX_INVALID PICO_INVALID_SAMPLERATIO PICO_INVALID_CALL PICO_NOT_RESPONDING PICO_MEMORY

## 3.10.17 ps4000GetValuesAsync

```

PICO_STATUS ps4000GetValuesAsync
(
    int16_t      handle,
    uint32_t     startIndex,
    uint32_t     noOfSamples,
    uint32_t     downSampleRatio,
    int16_t      downSampleRatioMode,
    uint16_t     segmentIndex,
    void         * lpDataReady,
    void         * pParameter
)

```

This function returns streaming data, either with or without [aggregation](#), starting at the specified sample number. It is used to get the stored data from the scope after data collection has stopped. It returns the data using a [callback](#).

<b>Applicability</b>	<a href="#">Streaming mode</a> only
<b>Arguments</b>	<p>handle, the handle of the required device</p> <p>startIndex, see <a href="#">ps4000GetValues</a></p> <p>noOfSamples, see <a href="#">ps4000GetValues</a></p> <p>downSampleRatio, see <a href="#">ps4000GetValues</a></p> <p>downSampleRatioMode, see <a href="#">ps4000GetValues</a></p> <p>segmentIndex, see <a href="#">ps4000GetValues</a></p> <p>lpDataReady, a pointer to the <a href="#">ps4000StreamingReady</a> function that is called when the data is ready</p> <p>pParameter, a void pointer that will be passed to the <a href="#">ps4000StreamingReady</a> callback function. The data type depends on the design of the callback function, which is determined by the application programmer.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NO_SAMPLES_AVAILABLE PICO_DEVICE_SAMPLING – streaming only PICO_NULL_PARAMETER PICO_STARTINDEX_INVALID PICO_SEGMENT_OUT_OF_RANGE PICO_INVALID_PARAMETER PICO_DATA_NOT_AVAILABLE PICO_INVALID_SAMPLERATIO PICO_INVALID_CALL

## 3.10.18 ps4000GetValuesBulk

```

PICO_STATUS ps4000GetValuesBulk
(
    int16_t    handle,
    uint32_t * noOfSamples,
    uint16_t   fromSegmentIndex,
    uint16_t   toSegmentIndex,
    int16_t *  overflow
)

```

This function allows more than one waveform to be retrieved at a time in [rapid block mode](#). The waveforms must have been collected sequentially and in the same run. This method of collection does not support [aggregation](#).

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p>* <code>noOfSamples</code>, On entering the API, the number of samples required. On exiting the API, the actual number retrieved. The number of samples retrieved will not be more than the number requested. The data retrieved always starts with the first sample captured.</p> <p><code>fromSegmentIndex</code>, the first segment from which the waveform should be retrieved</p> <p><code>toSegmentIndex</code>, the last segment from which the waveform should be retrieved</p> <p>* <code>overflow</code>, equal to or larger than the number of waveforms to be retrieved. Each segment index has a separate <code>overflow</code> element, with <code>overflow[0]</code> containing the <code>fromSegmentIndex</code> and the last index the <code>toSegmentIndex</code>.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_INVALID_PARAMETER PICO_SEGMENT_OUT_OF_RANGE PICO_NO_SAMPLES_AVAILABLE PICO_STARTINDEX_INVALID PICO_NOT_RESPONDING

## 3.10.19 ps4000GetValuesTriggerChannelTimeOffsetBulk

```

PICO_STATUS ps4000GetValuesTriggerChannelTimeOffsetBulk
(
    int16_t          handle,
    uint32_t         * timesUpper,
    uint32_t         * timesLower,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         fromSegmentIndex,
    uint16_t         toSegmentIndex,
    PS4000_CHANNEL  channel
)

```

This function retrieves the time offset, as lower and upper 32-bit values, for a group of waveforms obtained in [rapid block mode](#), adjusted for the time skew relative to the trigger source. The array size for `timesUpper` and `timesLower` must be greater than or equal to the number of waveform time offsets requested. The segment indexes are inclusive.

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p>* <code>timesUpper</code>, a pointer to 32-bit integers. This will hold the most significant 32 bits of the time offset for each requested segment index. <code>times[0]</code> will hold the <code>fromSegmentIndex</code> time offset and the last <code>times</code> index will hold the <code>toSegmentIndex</code> time offset.</p> <p>* <code>timesLower</code>, a pointer to 32-bit integers. This will hold the least-significant 32 bits of the time offset for each requested segment index. <code>times[0]</code> will hold the <code>fromSegmentIndex</code> time offset and the last <code>times</code> index will hold the <code>toSegmentIndex</code> time offset.</p> <p>* <code>timeUnits</code>, a pointer to a range of <code>PS4000_TIME_UNITS</code>. This must be equal to or larger than the number of requested times. <code>timeUnits[0]</code> will contain the time unit for <code>fromSegmentIndex</code> and the last index will contain the time unit for <code>toSegmentIndex</code>.</p> <p><code>fromSegmentIndex</code>, the first segment for which the time offset is required</p> <p><code>toSegmentIndex</code>, the last segment for which the time offset is required. If <code>toSegmentIndex</code> is less than <code>fromSegmentIndex</code> then the driver will wrap around from the last segment to the first.</p> <p><code>channel</code>, the channel for which the information is required.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_NULL_PARAMETER</p> <p>PICO_DEVICE_SAMPLING</p> <p>PICO_SEGMENT_OUT_OF_RANGE</p> <p>PICO_NO_SAMPLES_AVAILABLE</p>

## 3.10.20 ps4000GetValuesTriggerChannelTimeOffsetBulk64

```

PICO_STATUS ps4000GetValuesTriggerChannelTimeOffsetBulk64
(
    int16_t          handle,
    int64_t          * times,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         fromSegmentIndex,
    uint16_t         toSegmentIndex,
    PS4000_CHANNEL   channel
)

```

This function retrieves the time offset, as a 64-bit integer, for a group of waveforms captured in [rapid block mode](#), adjusted for the time skew relative to the trigger source. The array size of `times` must be greater than or equal to the number of waveform time offsets requested. The segment indexes are inclusive.

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p>* <code>times</code>, a pointer to 64-bit integers. This will hold the time offset for each requested segment index. <code>times[0]</code> will hold the time offset for <code>fromSegmentIndex</code>, and the last <code>times</code> index will hold the time offset for <code>toSegmentIndex</code>.</p> <p>* <code>timeUnits</code>, a pointer to a range of <code>PS4000_TIME_UNITS</code>. This must be equal or larger than the number of requested times. <code>timeUnits[0]</code> will contain the time unit for <code>fromSegmentIndex</code>, and the last index will contain the <code>toSegmentIndex</code>.</p> <p><code>fromSegmentIndex</code>, the first segment for which the time offset is required. The result will be placed in <code>times[0]</code> and <code>timeUnits[0]</code>.</p> <p><code>toSegmentIndex</code>, the last segment for which the time offset is required. The result will be placed in the last elements of the <code>times</code> and <code>timeUnits</code> arrays. If <code>toSegmentIndex</code> is less than <code>fromSegmentIndex</code> then the driver will wrap around from the last segment to the first.</p> <p><code>channel</code>, the scope channel for which information is required</p>
<b>Returns</b>	<p><code>PICO_OK</code>  <code>PICO_INVALID_HANDLE</code>  <code>PICO_NULL_PARAMETER</code>  <code>PICO_DEVICE_SAMPLING</code>  <code>PICO_SEGMENT_OUT_OF_RANGE</code>  <code>PICO_NO_SAMPLES_AVAILABLE</code></p>

## 3.10.21 ps4000GetValuesTriggerTimeOffsetBulk

```

PICO_STATUS ps4000GetValuesTriggerTimeOffsetBulk
(
    int16_t          handle,
    uint32_t         * timesUpper,
    uint32_t         * timesLower,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         fromSegmentIndex,
    uint16_t         toSegmentIndex
)

```

This function retrieves the time offset, as lower and upper 32-bit values, for a group of waveforms obtained in [rapid block mode](#). The array size for `timesUpper` and `timesLower` must be greater than or equal to the number of waveform time offsets requested. The segment indexes are inclusive.

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p>* <code>timesUpper</code>, a pointer to 32-bit integers. This will hold the most significant 32 bits of the time offset for each requested segment index. <code>times[0]</code> will hold the <code>fromSegmentIndex</code> time offset and the last <code>times</code> index will hold the <code>toSegmentIndex</code> time offset.</p> <p>* <code>timesLower</code>, a pointer to 32-bit integers. This will hold the least-significant 32 bits of the time offset for each requested segment index. <code>times[0]</code> will hold the <code>fromSegmentIndex</code> time offset and the last <code>times</code> index will hold the <code>toSegmentIndex</code> time offset.</p> <p>* <code>timeUnits</code>, a pointer to a range of <code>PS4000_TIME_UNITS</code>. This must be equal to or larger than the number of requested times. <code>timeUnits[0]</code> will contain the time unit for <code>fromSegmentIndex</code> and the last index will contain the time unit for <code>toSegmentIndex</code>.</p> <p><code>fromSegmentIndex</code>, the first segment for which the time offset is required</p> <p><code>toSegmentIndex</code>, the last segment for which the time offset is required. If <code>toSegmentIndex</code> is less than <code>fromSegmentIndex</code> then the driver will wrap around from the last segment to the first.</p>
<b>Returns</b>	<p><code>PICO_OK</code>  <code>PICO_INVALID_HANDLE</code>  <code>PICO_NULL_PARAMETER</code>  <code>PICO_DEVICE_SAMPLING</code>  <code>PICO_SEGMENT_OUT_OF_RANGE</code>  <code>PICO_NO_SAMPLES_AVAILABLE</code></p>

## 3.10.22 ps4000GetValuesTriggerTimeOffsetBulk64

```

PICO_STATUS ps4000GetValuesTriggerTimeOffsetBulk64
(
    int16_t          handle,
    int64_t          * times,
    PS4000_TIME_UNITS * timeUnits,
    uint16_t         fromSegmentIndex,
    uint16_t         toSegmentIndex
)

```

This function retrieves the time offset, as a 64-bit integer, for a group of waveforms captured in [rapid block mode](#). The array size of `times` must be greater than or equal to the number of waveform time offsets requested. The segment indexes are inclusive.

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p>* <code>times</code>, a pointer to 64-bit integers. This will hold the time offset for each requested segment index. <code>times[0]</code> will hold the time offset for <code>fromSegmentIndex</code>, and the last <code>times</code> index will hold the time offset for <code>toSegmentIndex</code>.</p> <p>* <code>timeUnits</code>, a pointer to a range of <code>PS4000_TIME_UNITS</code>. This must be equal or larger than the number of requested times. <code>timeUnits[0]</code> will contain the time unit for <code>fromSegmentIndex</code>, and the last index will contain the <code>toSegmentIndex</code>.</p> <p><code>fromSegmentIndex</code>:, the first segment for which the time offset is required. The result will be placed in <code>times[0]</code> and <code>timeUnits[0]</code>.</p> <p><code>toSegmentIndex</code>, the last segment for which the time offset is required. The result will be placed in the last elements of the <code>times</code> and <code>timeUnits</code> arrays. If <code>toSegmentIndex</code> is less than <code>fromSegmentIndex</code> then the driver will wrap around from the last segment to the first.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_NULL_PARAMETER</p> <p>PICO_DEVICE_SAMPLING</p> <p>PICO_SEGMENT_OUT_OF_RANGE</p> <p>PICO_NO_SAMPLES_AVAILABLE</p>

## 3.10.23 ps4000HoldOff

```

PICO_STATUS ps4000HoldOff
(
    int16_t          handle,
    uint64_t         holdoff,
    PS4000_HOLDOFF_TYPE type
)

```

This function sets the holdoff time - the time that the scope waits after each trigger event before allowing the next trigger event.

<b>Applicability</b>	Not currently supported. Reserved for future use.
<b>Arguments</b>	<p><code>holdoff</code>, the number of samples between trigger events. The time is calculated by multiplying the sample interval by the holdoff.</p> <p><code>type</code>, the type of hold-off. Only holdoff by time is currently supported:  <code>PS4000_TIME</code></p>
<b>Returns</b>	<code>PICO_OK</code> - success <code>PICO_DRIVER_FUNCTION</code> <code>PICO_INVALID_PARAMETER</code>

## 3.10.24 ps4000IsLedFlashing

```

PICO_STATUS ps4000IsLedFlashing
(
    int16_t    handle,
    int16_t * status
)

```

This function reports whether or not the LED is flashing.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the scope device</p> <p><code>status</code>, returns a flag indicating the status of the LED:</p> <p>&lt;&gt; 0 : flashing</p> <p>0 : not flashing</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_HANDLE_INVALID</p> <p>PICO_NULL_PARAMETER</p>

## 3.10.25 ps4000IsReady

```
PICO_STATUS ps4000IsReady
(
    int16_t    handle,
    int16_t * ready
)
```

This function may be used instead of a callback function to receive data from [ps4000RunBlock](#). To use this method, pass a NULL pointer as the `lpReady` argument to [ps4000RunBlock](#). You must then poll the driver to see if it has finished collecting the requested samples.

<b>Applicability</b>	<a href="#">Block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>ready</code>, on exit, indicates the state of the collection. If zero, the device is still collecting. If non-zero, the device has finished collecting and <a href="#">ps4000GetValues</a> can be used to retrieve the data.</p>
<b>Returns</b>	

## 3.10.26 ps4000IsTriggerOrPulseWidthQualifierEnabled

```

PICO_STATUS ps4000IsTriggerOrPulseWidthQualifierEnabled
(
    int16_t    handle,
    int16_t *  triggerEnabled,
    int16_t *  pulseWidthQualifierEnabled
)

```

This function discovers whether a trigger, or pulse width triggering, is enabled.

<b>Applicability</b>	Call after setting up the trigger, and just before calling either <a href="#">ps4000RunBlock</a> or <a href="#">ps4000RunStreaming</a> .
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>triggerEnabled</code>, indicates whether the trigger will successfully be set when <a href="#">ps4000RunBlock</a> or <a href="#">ps4000RunStreaming</a> is called. A non-zero value indicates that the trigger is set, otherwise the trigger is not set.</p> <p><code>pulseWidthQualifierEnabled</code>, indicates whether the pulse width qualifier will successfully be set when <a href="#">ps4000RunBlock</a> or <a href="#">ps4000RunStreaming</a> is called. A non-zero value indicates that the pulse width qualifier is set, otherwise the pulse width qualifier is not set.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NULL_PARAMETER

## 3.10.27 ps4000MemorySegments

```

PICO_STATUS ps4000MemorySegments
(
    int16_t    handle
    uint16_t   nSegments,
    int32_t    * nMaxSamples
)

```

This function sets the number of memory segments that the scope device will use.

By default, each capture fills the scope device's available memory. This function allows you to divide the memory into a number of segments so that the scope can store several captures sequentially. The number of segments defaults to 1 when the scope device is opened.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>nSegments</code>, the number of segments to be used, from 1 to 8192</p> <p><code>nMaxSamples</code>, returns the number of samples that are available in each segment. This is independent of the number of channels, so if more than one channel is in use then the number of samples available to each channel is <code>nMaxSamples</code> divided by the number of channels.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_USER_CALLBACK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_TOO_MANY_SEGMENTS</p> <p>PICO_MEMORY</p>

## 3.10.28 ps4000NoOfStreamingValues

```

PICO_STATUS ps4000NoOfStreamingValues
(
    int16_t    handle,
    uint32_t * noOfValues
)

```

This function returns the available number of samples from a streaming run.

<b>Applicability</b>	<a href="#">Streaming mode</a> . Call after <a href="#">ps4000Stop</a> .
<b>Arguments</b>	<p>handle, the handle of the required device</p> <p>noOfValues, returns the number of samples</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NULL_PARAMETER PICO_NO_SAMPLES_AVAILABLE PICO_NOT_USED PICO_BUSY

## 3.10.29 ps4000OpenUnit

```

PICO_STATUS ps4000OpenUnit
(
    int16_t * handle
)

```

This function opens a scope device. The maximum number of units that can be opened is determined by the operating system, the kernel driver and the PC's hardware.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p>handle, pointer to an int16_t that receives the handle number:</p> <ul style="list-style-type: none"> <li>-1 : if the unit fails to open,</li> <li>0 : if no unit is found or</li> <li>&gt; 0 : if successful (value is handle of the device opened)</li> </ul> <p>The handle number must be used in all subsequent calls to API functions to identify this scope device.</p>
<b>Returns</b>	<p>PICO_OK  PICO_OS_NOT_SUPPORTED  PICO_OPEN_OPERATION_IN_PROGRESS  PICO_EEPROM_CORRUPT  PICO_KERNEL_DRIVER_TOO_OLD  PICO_FW_FAIL  PICO_MAX_UNITS_OPENED  PICO_NOT_FOUND  PICO_NOT_RESPONDING</p>

## 3.10.30 ps4000OpenUnitAsync

```

PICO\_STATUS ps4000OpenUnitAsync
(
    int16_t * status
)

```

This function opens a scope device without blocking the calling thread. You can find out when it has finished by periodically calling [ps4000OpenUnitProgress](#) until that function returns a non-zero value.

<b>Applicability</b>	All modes
<b>Arguments</b>	status, pointer to an <code>int16_t</code> that indicates: 0 if there is already an open operation in progress 1 if the open operation is initiated
<b>Returns</b>	PICO_OK PICO_OPEN_OPERATION_IN_PROGRESS PICO_OPERATION_FAILED

## 3.10.31 ps4000OpenUnitAsyncEx

```

PICO_STATUS ps4000OpenUnitAsyncEx
(
    int16_t * status,
    int8_t * serial
)

```

This function opens a scope device selected by serial number without blocking the calling thread. You can find out when it has finished by periodically calling [ps4000OpenUnitProgress](#) until that function returns a non-zero value.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>status</code>, pointer to a <code>int16_t</code> that indicates:</p> <ul style="list-style-type: none"> <li>0 if there is already an open operation in progress</li> <li>1 if the open operation is initiated</li> </ul> <p><code>serial</code>, the serial number of the device to be opened. A null-terminated string.</p>
<b>Returns</b>	<p>PICO_OK  PICO_OPEN_OPERATION_IN_PROGRESS  PICO_OPERATION_FAILED</p>

## 3.10.32 ps4000OpenUnitEx

```

PICO_STATUS ps4000OpenUnitEx
(
    int16_t * handle,
    int8_t * serial
)

```

This function opens a scope device. The maximum number of units that can be opened is determined by the operating system, the kernel driver and the PC's hardware.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, pointer to an <code>int16_t</code> that receives the handle number:          -1 : if the unit fails to open,          0 : if no unit is found or          &gt; 0 : if successful (value is handle to the device opened)          The handle number must be used in all subsequent calls to API functions to identify this scope device.</p> <p><code>serial</code>, the serial number of the device to be opened. A null-terminated string.</p>
<b>Returns</b>	PICO_OK PICO_OS_NOT_SUPPORTED PICO_OPEN_OPERATION_IN_PROGRESS PICO_EEPROM_CORRUPT PICO_KERNEL_DRIVER_TOO_OLD PICO_FW_FAIL PICO_MAX_UNITS_OPENED PICO_NOT_FOUND PICO_NOT_RESPONDING

## 3.10.33 ps4000OpenUnitProgress

```

PICO_STATUS ps4000OpenUnitProgress
(
    int16_t * handle,
    int16_t * progressPercent,
    int16_t * complete
)

```

This function checks on the progress of [ps4000OpenUnitAsync](#).

<b>Applicability</b>	Use after <a href="#">ps4000OpenUnitAsync</a>
<b>Arguments</b>	<p><code>handle</code>, pointer to an <code>int16_t</code> where the unit handle is to be written. -1 if the unit fails to open, 0 if no unit is found or a non-zero handle to the device.</p> <p><b>Note:</b> This handle is not valid unless the function returns <code>PICO_OK</code>.</p> <p><code>progressPercent</code>, pointer to an <code>int16_t</code> to which the percentage progress is to be written. 100% implies that the open operation is complete.</p> <p><code>complete</code>, pointer to an <code>int16_t</code> that is set to 1 when the open operation has finished</p>
<b>Returns</b>	<p><code>PICO_OK</code>  <code>PICO_NULL_PARAMETER</code>  <code>PICO_OPERATION_FAILED</code></p>

## 3.10.34 ps4000RunBlock

```
PICO STATUS ps4000RunBlock
(
    int16_t          handle,
    int32_t          noOfPreTriggerSamples,
    int32_t          noOfPostTriggerSamples,
    uint32_t         timebase,
    int16_t          oversample,
    int32_t          * timeIndisposedMs,
    uint16_t         segmentIndex,
    ps4000BlockReady lpReady,
    void             * pParameter
)
```

This function starts a collection of data points (samples) in block mode.

The number of samples is determined by `noOfPreTriggerSamples` and `noOfPostTriggerSamples` (see below for details). The total number of samples must not be more than the memory depth of the [segment](#) referred to by `segmentIndex`.

<b>Applicability</b>	<a href="#">Block mode</a> , <a href="#">rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>noOfPreTriggerSamples</code>, the number of samples to return before the trigger event. If no trigger has been set then this argument is ignored and <code>noOfPostTriggerSamples</code> specifies the maximum number of data points (samples) to collect.</p> <p><code>noOfPostTriggerSamples</code>, the number of samples to be taken after a trigger event. If no trigger event is set then this specifies the maximum number of samples to be taken. If a trigger condition has been set, this specifies the number of data points (samples) to be taken after a trigger has fired, and the number of data points to be collected is:</p> $\text{noOfPreTriggerSamples} + \text{noOfPostTriggerSamples}$ <p><code>timebase</code>, a number in the range 0 to <math>2^{30}-1</math>. See the <a href="#">guide to calculating timebase values</a>.</p> <p><code>oversample</code>, the <a href="#">oversampling</a> factor, a number in the range 1 to 16.</p> <p><code>timeIndisposedMs</code>, returns the time, in milliseconds, that the PicoScope4000 will spend collecting samples. This does not include any auto trigger timeout. If this pointer is null, nothing will be written here.</p> <p><code>segmentIndex</code>, zero-based, specifies which <a href="#">memory segment</a> to use.</p> <p><code>lpReady</code>, a pointer to the <a href="#">ps4000BlockReady</a> callback that the driver will call when the data has been collected. To use the <a href="#">ps4000IsReady</a> polling method instead of a callback function, set this pointer to NULL.</p> <p><code>pParameter</code>, a void pointer that is passed to the <a href="#">ps4000BlockReady</a> callback function. The callback can use the pointer to return arbitrary data to your application.</p>
<b>Returns</b>	<pre>PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK PICO_SEGMENT_OUT_OF_RANGE PICO_INVALID_CHANNEL PICO_INVALID_TRIGGER_CHANNEL PICO_INVALID_CONDITION_CHANNEL PICO_TOO_MANY_SAMPLES PICO_INVALID_TIMEBASE PICO_NOT_RESPONDING PICO_CONFIG_FAIL PICO_INVALID_PARAMETER PICO_NOT_RESPONDING PICO_TRIGGER_ERROR</pre>

## 3.10.35 ps4000RunStreaming

```
PICO STATUS ps4000RunStreaming
(
    int16_t          handle,
    uint32_t         * sampleInterval,
    PS4000 TIME UNITS sampleIntervalTimeUnits,
    uint32_t         maxPreTriggerSamples,
    uint32_t         maxPostTriggerSamples,
    int16_t          autoStop,
    uint32_t         downSampleRatio,
    uint32_t         overviewBufferSize
)
```

This function tells the oscilloscope to start collecting data in [streaming mode](#). When data has been collected from the device it is [aggregated](#) and the values returned to the application. Call [ps4000GetStreamingLatestValues](#) to retrieve the data.

When a trigger is set, the sum of `maxPreTriggerSamples` and `maxPostTriggerSamples` is the total number of samples stored in the driver. If `autoStop` is false then this will become the maximum number of unaggregated samples.

<b>Applicability</b>	<a href="#">Streaming mode</a> only
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>sampleInterval</code>, a pointer to the requested time interval between data points on entry and the actual time interval assigned on exit.</p> <p><code>sampleIntervalTimeUnits</code>, the unit of time that the <code>sampleInterval</code> is set to. Use one of these values:</p> <pre> PS4000_FS PS4000_PS PS4000_NS PS4000_US PS4000_MS PS4000_S </pre> <p><code>maxPreTriggerSamples</code>, the maximum number of raw samples before a trigger condition for each enabled channel. If no trigger condition is set this argument is ignored.</p> <p><code>maxPostTriggerSamples</code>, the maximum number of raw samples after a trigger condition for each enabled channel. If no trigger condition is set this argument states the maximum number of samples to be stored.</p> <p><code>autoStop</code>, a flag to specify if the streaming should stop when all of <code>maxSamples</code> have been taken.</p> <p><code>downSampleRatio</code>, the number of raw values to each aggregated value.</p> <p><code>overviewBufferSize</code>, the size of the overview buffers. These are temporary buffers used for storing the data before returning it to the application. The size is the same as the <code>bufferLth</code> value passed to <a href="#">ps4000SetDataBuffer</a>.</p>
<b>Returns</b>	<pre> PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK PICO_NULL_PARAMETER PICO_INVALID_PARAMETER PICO_STREAMING_FAILED PICO_NOT_RESPONDING PICO_TRIGGER_ERROR PICO_INVALID_SAMPLE_INTERVAL PICO_INVALID_BUFFER </pre>

## 3.10.36 ps4000RunStreamingEx

```
PICO STATUS ps4000RunStreamingEx
(
    int16_t          handle,
    uint32_t         * sampleInterval,
    PS4000 TIME UNITS sampleIntervalTimeUnits,
    uint32_t         maxPreTriggerSamples,
    uint32_t         maxPostTriggerSamples,
    int16_t          autoStop,
    uint32_t         downSampleRatio,
    int16_t          downSampleRatioMode,
    uint32_t         overviewBufferSize
)
```

This function tells the oscilloscope to start collecting data in [streaming mode](#) and with a specified data reduction mode. When data has been collected from the device it is [aggregated](#) and the values returned to the application. Call [ps4000GetStreamingLatestValues](#) to retrieve the data.

When a trigger is set, the sum of `maxPreTriggerSamples` and `maxPostTriggerSamples` is the total number of samples stored in the driver. If `autoStop` is false then this will become the maximum number of unaggregated samples.

<b>Applicability</b>	<a href="#">Streaming mode</a> only
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>sampleInterval</code>, a pointer to the requested time interval between data points on entry and the actual time interval assigned on exit.</p> <p><code>sampleIntervalTimeUnits</code>, the unit of time that the <code>sampleInterval</code> is set to. Use one of these values:</p> <pre> PS4000_FS PS4000_PS PS4000_NS PS4000_US PS4000_MS PS4000_S </pre> <p><code>maxPreTriggerSamples</code>, the maximum number of raw samples before a trigger condition for each enabled channel. If no trigger condition is set this argument is ignored.</p> <p><code>maxPostTriggerSamples</code>, the maximum number of raw samples after a trigger condition for each enabled channel. If no trigger condition is set this argument states the maximum number of samples to be stored.</p> <p><code>autoStop</code>, a flag to specify if the streaming should stop when all of <code>maxSamples</code> have been taken.</p> <p><code>downSampleRatio</code>, the number of raw values to each aggregated value.</p> <p><code>downSampleRatioMode</code>, the <a href="#">data reduction mode</a> to use.</p> <p><code>overviewBufferSize</code>, the size of the overview buffers. These are temporary buffers used for storing the data before returning it to the application. The size is the same as the <code>bufferLth</code> value passed to <a href="#">ps4000SetDataBuffer</a>.</p>
<b>Returns</b>	<pre> PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK PICO_NULL_PARAMETER PICO_INVALID_PARAMETER PICO_STREAMING_FAILED PICO_NOT_RESPONDING PICO_TRIGGER_ERROR PICO_INVALID_SAMPLE_INTERVAL PICO_INVALID_BUFFER </pre>

## 3.10.37 ps4000SetBwFilter

```

PICO_STATUS ps4000SetBwFilter
(
    int16_t      handle,
    PS4000_CHANNEL channel,
    int16_t      enable
)

```

This function enables or disables the bandwidth-limiting filter on the specified channel.

<b>Applicability</b>	PicoScope 4262 only
<b>Arguments</b>	<p>handle, the handle of the required device</p> <p>channel, an enumerated type. The values are:  PS4000_CHANNEL_A  PS4000_CHANNEL_B</p> <p>enable, whether to enable or disable the filter:  TRUE = enable  FALSE = disable</p>
<b>Returns</b>	PICO_OK PICO_USER_CALLBACK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL

## 3.10.38 ps4000SetChannel

```

PICO_STATUS ps4000SetChannel
(
    int16_t      handle,
    PS4000_CHANNEL channel,
    int16_t      enabled,
    int16_t      dc,
    PS4000_RANGE range
)

```

This function specifies whether an input channel is to be enabled, the [AC/DC coupling](#) mode and the voltage range.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p>handle, the handle of the required device</p> <p>channel, an enumerated type. The values are: -            PS4000_CHANNEL_A            PS4000_CHANNEL_B            PS4000_CHANNEL_C (4-channel scopes only)            PS4000_CHANNEL_D (4-channel scopes only)</p> <p>enabled, specifies if the channel is active. The values are: -            TRUE = active            FALSE = inactive</p> <p>dc, specifies the <a href="#">AC/DC coupling</a> mode. The values are: -            TRUE = DC            FALSE = AC</p> <p>range, specifies the measuring range. Measuring ranges 0 to 12, for standard scopes, are shown in the <a href="#">table below</a>. Additional ranges for special-purpose scopes are listed under <a href="#">PS4000_RANGE</a>. For example, to enable <a href="#">IEPE</a> input mode on an IEPE-enabled scope, select one of the ranges beginning with PS4000_ACCELEROMETER_.</p>
<b>Returns</b>	PICO_OK PICO_USER_CALLBACK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL PICO_INVALID_VOLTAGE_RANGE

range		Voltage range
0	PS4000_10MV	±10 mV
1	PS4000_20MV	±20 mV
2	PS4000_50MV	±50 mV
3	PS4000_100MV	±100 mV
4	PS4000_200MV	±200 mV
5	PS4000_500MV	±500 mV
6	PS4000_1V	±1 V
7	PS4000_2V	±2 V
8	PS4000_5V	±5 V
9	PS4000_10V	±10 V
10	PS4000_20V	±20 V
11	PS4000_50V	±50 V
12	PS4000_100V	±100 V

## 3.10.39 ps4000SetDataBuffer

```

PICO_STATUS ps4000SetDataBuffer
(
    int16_t      handle,
    PS4000_CHANNEL channel,
    int16_t      * buffer,
    int32_t      bufferLth
)

```

This function registers your data buffer, for non-[aggregated](#) data, with the PicoScope 4000 driver. You need to allocate the buffer before calling this function.

<b>Applicability</b>	All modes.  For aggregated data, use <a href="#">ps4000SetDataBuffers</a> instead.
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>channel</code>, the channel for which you want to set the buffers. Use one of these values: -</p> <ul style="list-style-type: none"> <li>PS4000_CHANNEL_A</li> <li>PS4000_CHANNEL_B</li> <li>PS4000_CHANNEL_C (4-channel scopes only)</li> <li>PS4000_CHANNEL_D (4-channel scopes only)</li> </ul> <p><code>buffer</code>, a buffer to receive the data values</p> <p><code>bufferLth</code>, the size of the <code>buffer</code> array</p>
<b>Returns</b>	<ul style="list-style-type: none"> <li>PICO_OK</li> <li>PICO_INVALID_HANDLE</li> <li>PICO_INVALID_CHANNEL</li> </ul>

## 3.10.40 ps4000SetDataBufferBulk

```

PICO_STATUS ps4000SetDataBufferBulk
(
    int16_t      handle,
    PS4000_CHANNEL channel,
    int16_t      * buffer,
    int32_t      bufferLth,
    uint16_t     waveform
)

```

This function allows the buffers to be set for each waveform in [rapid block mode](#). The number of waveforms captured is determined by the `nCaptures` argument sent to [ps4000SetNoOfCaptures](#). There is only one buffer for each waveform, because bulk collection does not support [aggregation](#).

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p><code>handle</code>, the handle of the device</p> <p><code>channel</code>, the scope channel with which the buffer is to be associated. The data should be retrieved from this channel by calling one of the <a href="#">GetValues</a> functions.</p> <p><code>* buffer</code>, an array in which the captured data is stored</p> <p><code>bufferLth</code>, the size of the buffer</p> <p><code>waveform</code>, an index to the waveform number, between 0 and <code>nCaptures-1</code></p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL PICO_INVALID_PARAMETER

## 3.10.41 ps4000SetDataBuffers

```

PICO_STATUS ps4000SetDataBuffers
(
    int16_t      handle,
    PS4000_CHANNEL channel,
    int16_t      * bufferMax,
    int16_t      * bufferMin,
    int32_t      bufferLth
)

```

This function registers your data buffers, for receiving [aggregated](#) data, with the PicoScope 4000 driver. You need to allocate memory for the buffers before calling this function.

<b>Applicability</b>	All sampling modes.  For non-aggregated data, use <a href="#">ps4000SetDataBuffer</a> instead.
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>channel</code>, the channel for which you want to set the buffers. Use one of these constants: -            PS4000_CHANNEL_A            PS4000_CHANNEL_B            PS4000_CHANNEL_C (4-channel scopes only)            PS4000_CHANNEL_D (4-channel scopes only)</p> <p><code>bufferMax</code>, a buffer to receive the maximum data values in aggregation mode, or the non-aggregated values otherwise.</p> <p><code>bufferMin</code>, a buffer to receive the minimum data values when <code>downSampleRatio &gt; 1</code>. Not used when <code>downSampleRatio</code> is 1.</p> <p><code>bufferLth</code>, specifies the size of the <code>bufferMax</code> and <code>bufferMin</code> arrays.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL

## 3.10.42 ps4000SetDataBuffersWithMode

```

PICO_STATUS ps4000SetDataBuffersWithMode
(
    int16_t          handle,
    PS4000_CHANNEL channel,
    int16_t          * bufferMax,
    int16_t          * bufferMin,
    int32_t          bufferLth,
    RATIO_MODE      mode
)

```

This function registers your data buffers, for receiving [aggregated](#) data, with the PicoScope 4000 driver. You need to allocate memory for the buffers before calling this function.

<b>Applicability</b>	All sampling modes.  For non-aggregated data, use <a href="#">ps4000SetDataBuffer</a> instead.
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>channel</code>, the channel for which you want to set the buffers. Use one of these constants: -            PS4000_CHANNEL_A            PS4000_CHANNEL_B            PS4000_CHANNEL_C (4-channel scopes only)            PS4000_CHANNEL_D (4-channel scopes only)</p> <p><code>bufferMax</code>, a buffer to receive the maximum data values in aggregation mode, or the non-aggregated values otherwise.</p> <p><code>bufferMin</code>, a buffer to receive the minimum data values when <code>downSampleRatio &gt; 1</code>. Not used when <code>downSampleRatio</code> is 1.</p> <p><code>bufferLth</code>, specifies the size of the <code>bufferMax</code> and <code>bufferMin</code> arrays.</p> <p><code>mode</code>, the data reduction mode to use</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL

## 3.10.43 ps4000SetDataBufferWithMode

```

PICO_STATUS ps4000SetDataBufferWithMode
(
    int16_t          handle,
    PS4000_CHANNEL channel,
    int16_t          * buffer,
    int32_t          bufferLth,
    RATIO_MODE     mode
)

```

This function registers your data buffer, for non-[aggregated](#) data, with the PicoScope 4000 driver. You need to allocate the buffer before calling this function.

<b>Applicability</b>	All modes.  For aggregated data, use <a href="#">ps4000SetDataBuffers</a> instead.
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>channel</code>, the channel for which you want to set the buffers. Use one of these values: -              PS4000_CHANNEL_A              PS4000_CHANNEL_B              PS4000_CHANNEL_C (4-channel scopes only)              PS4000_CHANNEL_D (4-channel scopes only)</p> <p><code>buffer</code>, a buffer to receive the data values</p> <p><code>bufferLth</code>, the size of the <code>buffer</code> array</p> <p><code>mode</code>, the type of data reduction to use</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_INVALID_CHANNEL

## 3.10.44 ps4000SetEts

```

PICO STATUS ps4000SetEts
(
    int16_t      handle,
    PS4000_ETS_MODE mode,
    int16_t      etsCycles,
    int16_t      etsInterleave,
    int32_t      * sampleTimePicoseconds
)

```

This function is used to enable or disable [ETS](#) (equivalent time sampling) and to set the ETS parameters.

<b>Applicability</b>	<a href="#">Block mode</a> only. ETS is not supported by PicoScope 4262.						
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>mode</code>, the ETS mode. Use one of these values: -</p> <table> <tr> <td><code>PS4000_ETS_OFF</code></td> <td>disables ETS</td> </tr> <tr> <td><code>PS4000_ETS_FAST</code></td> <td>enables ETS and provides <code>ets_cycles</code> cycles of data, which may contain data from previously returned cycles</td> </tr> <tr> <td><code>PS4000_ETS_SLOW</code></td> <td>enables ETS and provides fresh data every <code>ets_cycles</code> cycles. This mode takes longer to provide each data set, but the data sets are more stable and are guaranteed to contain only new data.</td> </tr> </table> <p><code>ets_cycles</code>, the number of cycles to store: the computer can then select <code>ets_interleave</code> cycles to give the most uniform spread of samples. <code>ets_cycles</code> should be between two and five times the value of <code>ets_interleave</code>.</p> <p><code>ets_interleave</code>, the number of ETS interleaves to use. If the sample time is 20 ns and the interleave is 10, the approximate time per sample will be 2 ns.</p> <p><code>sampleTimePicoseconds</code>, returns the effective sample time used by the function</p>	<code>PS4000_ETS_OFF</code>	disables ETS	<code>PS4000_ETS_FAST</code>	enables ETS and provides <code>ets_cycles</code> cycles of data, which may contain data from previously returned cycles	<code>PS4000_ETS_SLOW</code>	enables ETS and provides fresh data every <code>ets_cycles</code> cycles. This mode takes longer to provide each data set, but the data sets are more stable and are guaranteed to contain only new data.
<code>PS4000_ETS_OFF</code>	disables ETS						
<code>PS4000_ETS_FAST</code>	enables ETS and provides <code>ets_cycles</code> cycles of data, which may contain data from previously returned cycles						
<code>PS4000_ETS_SLOW</code>	enables ETS and provides fresh data every <code>ets_cycles</code> cycles. This mode takes longer to provide each data set, but the data sets are more stable and are guaranteed to contain only new data.						
<b>Returns</b>	<p><code>PICO_OK</code></p> <p><code>PICO_USER_CALLBACK</code></p> <p><code>PICO_INVALID_HANDLE</code></p> <p><code>PICO_INVALID_PARAMETER</code></p>						

## 3.10.45 ps4000SetEtsTimeBuffer

```

PICO_STATUS ps4000SetEtsTimeBuffer
(
    int16_t    handle,
    int64_t *  buffer,
    int32_t    bufferLth
)

```

This function tells the PicoScope 4000 driver where to find your application's ETS time buffers. These buffers contain the 64-bit timing information for each ETS sample after you run a block-mode ETS capture.

<b>Applicability</b>	<p><a href="#">ETS mode</a> only.</p> <p>ETS mode is not supported by the PicoScope 4262 oscilloscope.</p> <p>If your programming language does not support 64-bit data, use the 32-bit version <a href="#">ps4000SetEtsTimeBuffers</a> instead.</p>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>buffer</code>, a pointer to a set of 8-byte words, the time in nanoseconds at which the first data point occurred</p> <p><code>bufferLth</code>, the size of the buffer array</p>
<b>Returns</b>	<p>PICO_OK  PICO_INVALID_HANDLE  PICO_NULL_PARAMETER</p>

## 3.10.46 ps4000SetEtsTimeBuffers

```

PICO_STATUS ps4000SetEtsTimeBuffers
(
    int16_t    handle,
    uint32_t * timeUpper,
    uint32_t * timeLower,
    int32_t    bufferLth
)

```

This function tells the PicoScope 4000 driver where to find your application's ETS time buffers. These buffers contain the timing information for each ETS sample after you run a block-mode ETS capture. There are two buffers containing the upper and lower 32-bit parts of the timing information, to allow programming languages that do not support 64-bit data to retrieve the timings correctly.

Note: ETS mode is not supported by the PicoScope 4262 oscilloscope.

<b>Applicability</b>	<p><a href="#">ETS mode</a> only.</p> <p>If your programming language supports 64-bit data, then you can use <a href="#">ps4000SetEtsTimeBuffer</a> instead.</p>
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>timeUpper</code>, a pointer to a set of 4-byte words, the time in nanoseconds at which the first data point occurred, top 32 bits only</p> <p><code>timeLower</code>, a pointer to a set of 4-byte words, the time in nanoseconds at which the first data point occurred, bottom 32 bits only</p> <p><code>bufferLth</code>, the size of the <code>timeUpper</code> and <code>timeLower</code> arrays</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_NULL_PARAMETER</p>

## 3.10.47 ps4000SetExtTriggerRange

```

PICO_STATUS ps4000SetExtTriggerRange
(
    int16_t      handle,
    PS4000_RANGE extRange
)

```

This function sets the range of the external trigger.

<b>Applicability</b>	PicoScope 4262 only
<b>Arguments</b>	<p><code>handle</code>, the handle of the required oscilloscope</p> <p><code>extRange</code>, specifies the range for the external trigger (<math>\pm 500</math> mV or <math>\pm 5</math> V)</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_PARAMETER</p>

<b>extRange</b>		<b>Voltage range</b>
5	PS4000_500MV	$\pm 500$ mV
8	PS4000_5V	$\pm 5$ V

## 3.10.48 ps4000SetNoOfCaptures

```

PICO_STATUS ps4000SetNoOfCaptures
(
    int16_t handle,
    uint16_t nCaptures
)

```

This function sets the number of captures to be collected in one run of [rapid block mode](#). If you do not call this function before a run, the driver will capture one waveform.

<b>Applicability</b>	<a href="#">Rapid block mode</a>
<b>Arguments</b>	<p>handle, the handle of the device</p> <p>nCaptures, the number of waveforms to be captured in one run</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_INVALID_PARAMETER</p>

## 3.10.49 ps4000SetPulseWidthQualifier

```

PICO_STATUS ps4000SetPulseWidthQualifier
(
    int16_t          handle,
    PWQ_CONDITIONS * conditions,
    int16_t          nConditions,
    THRESHOLD_DIRECTION direction,
    uint32_t         lower,
    uint32_t         upper,
    PULSE_WIDTH_TYPE type
)

```

This function sets up pulse width qualification, which can be used on its own for pulse width triggering or combined with window triggering to produce more complex triggers. The pulse width qualifier is set by defining one or more conditions structures that are then ORed together. Each structure is itself the AND of the states of one or more of the inputs. This AND-OR logic allows you to create any possible Boolean function of the scope's inputs.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>conditions</code>, a pointer to an array of <a href="#">PWQ_CONDITIONS</a> structures specifying the conditions that should be applied to each channel. In the simplest case, the array consists of a single element. When there are several elements, the overall trigger condition is the logical OR of all the elements. If <code>conditions</code> is set to <code>null</code> then the pulse width qualifier is not used.</p> <p><code>nConditions</code>, the number of elements in the <code>conditions</code> array. If <code>nConditions</code> is zero then the pulse width qualifier is not used.</p> <p><code>direction</code>, the direction of the signal required for the trigger to fire</p> <p><code>lower</code>, the lower limit of the pulse width counter</p> <p><code>upper</code>, the upper limit of the pulse width counter. This parameter is used only when the type is set to <code>PW_TYPE_IN_RANGE</code> or <code>PW_TYPE_OUT_OF_RANGE</code>.</p> <p><code>type</code>, the pulse width type, one of these constants: -  <code>PW_TYPE_NONE</code> (do not use the pulse width qualifier)  <code>PW_TYPE_LESS_THAN</code> (pulse width less than <code>lower</code>)  <code>PW_TYPE_GREATER_THAN</code> (pulse width greater than <code>lower</code>)  <code>PW_TYPE_IN_RANGE</code> (pulse width between <code>lower</code> and <code>upper</code>)  <code>PW_TYPE_OUT_OF_RANGE</code> (pulse width not between <code>lower</code> and <code>upper</code>)</p>
<b>Returns</b>	<p><code>PICO_OK</code>  <code>PICO_INVALID_HANDLE</code>  <code>PICO_USER_CALLBACK</code>  <code>PICO_CONDITIONS</code>  <code>PICO_PULSE_WIDTH_QUALIFIER</code></p>

## 3.10.49.1 PWQ\_CONDITIONS structure

A structure of this type is passed to [ps4000SetPulseWidthQualifier](#) in the `conditions` argument to specify the trigger conditions, and is defined as follows: -

```
typedef struct tPwqConditions
{
    TRIGGER_STATE channelA;
    TRIGGER_STATE channelB;
    TRIGGER_STATE channelC;
    TRIGGER_STATE channelD;
    TRIGGER_STATE external;
    TRIGGER_STATE aux;
} PWQ_CONDITIONS
```

Each structure is the logical AND of the states of the scope's inputs. The [ps4000SetPulseWidthQualifier](#) function can OR together a number of these structures to produce the final pulse width qualifier, which can be any possible Boolean function of the scope's inputs.

<b>Elements</b>	<p><code>channelA</code>, <code>channelB</code>, <code>channelC</code>, <code>channelD</code>: the type of condition that should be applied to each channel. Use these constants:</p> <pre>-     CONDITION_DONT_CARE     CONDITION_TRUE     CONDITION_FALSE</pre> <p>The channels that are set to <code>CONDITION_TRUE</code> or <code>CONDITION_FALSE</code> must all meet their conditions simultaneously to produce a trigger. Channels set to <code>CONDITION_DONT_CARE</code> are ignored.</p> <p><code>external</code>, <code>aux</code>: not used</p>
-----------------	--

## 3.10.50 ps4000SetSigGenArbitrary

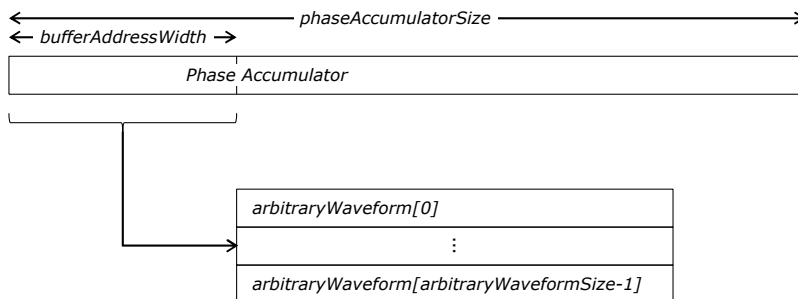

```

PICO STATUS ps4000SetSigGenArbitrary (
    int16_t      handle,
    int32_t      offsetVoltage,
    uint32_t     pkToPk,
    uint32_t     startDeltaPhase,
    uint32_t     stopDeltaPhase,
    uint32_t     deltaPhaseIncrement,
    uint32_t     dwellCount,
    int16_t      * arbitraryWaveform,
    int32_t      arbitraryWaveformSize,
    SWEEP_TYPE   sweepType,
    int16_t      operationType,
    INDEX_MODE   indexMode,
    uint32_t     shots,
    uint32_t     sweeps,
    SIGGEN_TRIG_TYPE triggerType,
    SIGGEN_TRIG_SOURCE triggerSource,
    int16_t      extInThreshold
)

```

This function instructs the signal generator to produce an arbitrary waveform.

The arbitrary waveform generator uses direct digital synthesis (DDS). It maintains a phase accumulator of *phaseAccumulatorSize* bits (see parameter table below) that indicates the present location in the waveform. The top *bufferAddressWidth* bits of the counter are used as an index into a buffer containing the arbitrary waveform. The remaining bits act as the fractional part of the index, enabling high-resolution control of output frequency and allowing the generation of lower frequencies.

The generator steps through the waveform by adding a *deltaPhase* value between 1 and  $2^{phaseAccumulatorSize}-1$  to the phase accumulator every clock period (*dacPeriod*). If the *deltaPhase* is constant, the generator produces a waveform at a constant frequency that can be calculated as follows:

$$outputFrequency = \frac{dacFrequency}{arbitraryWaveformSize} \times \frac{deltaPhase}{2^{(phaseAccumulatorSize - bufferAddressWidth)}}$$

It is also possible to sweep the frequency by continually modifying the *deltaPhase*. This is done by setting up a *deltaPhaseIncrement* that the oscilloscope adds to the *deltaPhase* at specified intervals.

Parameter	PicoScope 4226/4227	PicoScope 4262
<i>phaseAccumulatorSize</i>	32 bits	32 bits
<i>bufferAddressWidth</i>	13 bits	12 bits
<i>dacFrequency</i>	20 MHz	192 kHz
<i>dacPeriod</i> (= 1/ <i>dacFrequency</i> )	50 ns	≈ 5.208 μs

<b>Applicability</b>	PicoScope 4226, 4227 and 4262 only
<b>Arguments</b>	
<p><code>handle</code>, the <a href="#">handle</a> of the required device.</p> <p><code>offsetVoltage</code>, the voltage offset, in microvolts, to be applied to the waveform.</p> <p><code>pkToPk</code>, the peak-to-peak voltage, in microvolts, of the waveform signal.</p> <p><code>startDeltaPhase</code>, the initial value added to the phase counter as the generator begins to step through the waveform buffer.</p> <p><code>stopDeltaPhase</code>, the final value added to the phase counter before the generator restarts or reverses the sweep. When frequency sweeping is not required, set equal to <code>startDeltaPhase</code>.</p> <p><code>deltaPhaseIncrement</code>, the amount added to the delta phase value every time the <code>dwellCount</code> period expires. This determines the amount by which the generator sweeps the output frequency in each dwell period. When frequency sweeping is not required, set to zero.</p> <p><code>dwellCount</code>, the time, in multiples of <code>dacPeriod</code>, between successive additions of <code>deltaPhaseIncrement</code> to the delta phase counter. This determines the rate at which the generator sweeps the output frequency. Minimum allowable values are as follows:</p> <p style="padding-left: 20px;">PicoScope 4226 and 4227: <code>MIN_DWELL_COUNT</code> (10)  PicoScope 4262: <code>PS4262_MIN_DWELL_COUNT</code> (3)</p> <p><code>arbitraryWaveform</code>, a pointer to a buffer that holds the waveform pattern as a set of samples equally spaced in time. Sample value ranges are as follows:</p> <p style="padding-left: 20px;">PicoScope 4226 and 4227: [0, 4095]  PicoScope 4262: [-32768, 32767]</p> <p><code>arbitraryWaveformSize</code>, the size of the arbitrary waveform buffer, in samples:</p> <p style="padding-left: 20px;">All models: Min: <code>MIN_SIG_GEN_BUFFER_SIZE</code> (1)  PicoScope 4226 and 4227: Max: <code>MAX_SIG_GEN_BUFFER_SIZE</code> (8192)  PicoScope 4262: Max: <code>PS4262_MAX_WAVEFORM_BUFFER_SIZE</code> (4096)</p> <p><code>sweepType</code>, determines whether the <code>startDeltaPhase</code> is swept up to the <code>stopDeltaPhase</code>, or down to it, or repeatedly up and down. Use one of the following values: <code>UP</code>, <code>DOWN</code>, <code>UPDOWN</code>, <code>DOWNUP</code>.</p> <p><code>operationType</code>, configures the white noise/PRBS (pseudo-random binary sequence) generator:</p> <p style="padding-left: 20px;"><code>PS4000_OP_NONE</code>: White noise/PRBS output disabled. The waveform is defined by the other arguments.</p> <p style="padding-left: 20px;"><code>PS4000_WHITENOISE</code>: The signal generator produces white noise and ignores all settings except <code>offsetVoltage</code> and <code>pkTopk</code>.</p> <p style="padding-left: 20px;"><code>PS4000_PRBS</code>: The signal generator produces a PRBS (PicoScope 4262 only).</p> <p><code>indexMode</code>, specifies how the signal will be formed from the arbitrary waveform data. <code>SINGLE</code>, <code>DUAL</code> and <code>QUAD</code> index modes are possible (see <a href="#">AWG index modes</a>).</p>	

`shots`, the number of cycles of the waveform to be produced after a trigger event. If this is set to a non-zero value [`1`, `MAX_SWEEPS_SHOTS`], then `sweeps` must be set to zero.

`sweeps`, the number of times to sweep the frequency after a trigger event, according to `sweepType`. If this is set to a non-zero value [`1`, `MAX_SWEEPS_SHOTS`], then `shots` must be set to zero.

`triggerType`, the type of trigger that will be applied to the signal generator:

```
SIGGEN_RISING:      rising edge
SIGGEN_FALLING:     falling edge
SIGGEN_GATE_HIGH:   high level
SIGGEN_GATE_LOW:    low level
```

`triggerSource`, the source that will trigger the signal generator:

```
SIGGEN_NONE:        no trigger (free-running)
SIGGEN_SCOPE_TRIG:  the selected oscilloscope channel (see
                    ps4000SetSimpleTrigger)
SIGGEN_AUX_IN:      the AUX input
SIGGEN_EXT_IN:      the EXT input
SIGGEN_SOFT_TRIG:   a software trigger (see
                    ps4000SigGenSoftwareControl)
```

If a trigger source other than `SIGGEN_NONE` is specified, then either `shots` or `sweeps`, but not both, must be set to a non-zero value.

`extInThreshold`, an [ADC](#) count for use when the trigger source is `SIGGEN_EXT_IN`. If the EXT input is also being used as the scope trigger then the same ADC count must be specified in both places, otherwise a warning will be issued. Minimum and maximum 16-bit values correspond to the following voltages:

```
PicoScope 4226 & 4227: ±20 V
PicoScope 4262:       ±500 mV or ±5 V depending on range selected by
                    ps4000SetExtTriggerRange\(\)
```

<b>Returns</b>	0: if successful. Error code: if failed
----------------	--

## 3.10.50.1 AWG index modes

The [arbitrary waveform generator](#) supports SINGLE, DUAL and QUAD index modes to make the best use of the waveform buffer.

**SINGLE mode.** The generator outputs the raw contents of the buffer repeatedly. This mode is the only one that can generate asymmetrical waveforms. You can also use this mode for symmetrical waveforms, but the dual and quad modes make more efficient use of the buffer memory.

**DUAL mode.** The generator outputs the contents of the buffer from beginning to end, and then does a second pass in the reverse direction through the buffer. This allows you to specify only the first half of a waveform with twofold symmetry, such as a Gaussian function, and let the generator fill in the other half.

**QUAD mode.** The generator outputs the contents of the buffer, then on its second pass through the buffer outputs the same data in reverse order as in dual mode. On the third and fourth passes it does the same but with a negative version of the data. This allows you to specify only the first quarter of a waveform with fourfold symmetry, such as a sine wave, and let the generator fill in the other three quarters.

## 3.10.51 ps4000SetSigGenBuiltIn

```

PICO STATUS ps4000SetSigGenBuiltIn (
    int16_t          handle,
    int32_t          offsetVoltage,
    uint32_t         pkToPk,
    int16_t          waveType,
    float            startFrequency,
    float            stopFrequency,
    float            increment,
    float            dwellTime,
    SWEEP TYPE     sweepType,
    int16_t          operationType,
    uint32_t         shots,
    uint32_t         sweeps,
    SIGGEN TRIG TYPE triggerType,
    SIGGEN TRIG SOURCE triggerSource,
    int16_t          extInThreshold
)

```

This function sets up the signal generator to produce a signal from a list of built-in waveforms. If different start and stop frequencies are specified, the oscilloscope will sweep either up, down or up and down.

<b>Applicability</b>	PicoScope 4226, 4227 and 4262 only																				
<b>Arguments</b>	<p><code>handle</code>, the handle of the required oscilloscope.</p> <p><code>offsetVoltage</code>, the voltage offset, in microvolts, to be applied to the waveform.</p> <p><code>pkToPk</code>, the peak-to-peak voltage, in microvolts, of the waveform signal.</p> <p><code>waveType</code>, the type of waveform to be generated by the oscilloscope:</p> <table> <tr><td>PS4000_SINE</td><td>sine wave</td></tr> <tr><td>PS4000_SQUARE</td><td>square wave</td></tr> <tr><td>PS4000_TRIANGLE</td><td>triangle wave</td></tr> <tr><td>PS4000_RAMP_UP</td><td>rising sawtooth</td></tr> <tr><td>PS4000_RAMP_DOWN</td><td>falling sawtooth</td></tr> <tr><td>PS4000_SINC</td><td>sin(x)/x</td></tr> <tr><td>PS4000_GAUSSIAN</td><td>normal distribution</td></tr> <tr><td>PS4000_HALF_SINE</td><td>full-wave rectified sinusoid</td></tr> <tr><td>PS4000_DC_VOLTAGE</td><td>DC voltage</td></tr> <tr><td>PS4000_WHITE_NOISE</td><td>random values</td></tr> </table> <p><code>startFrequency</code>, the frequency at which the signal generator should begin. Range: <a href="#">MIN SIG GEN FREQ</a> to <a href="#">MAX SIG GEN FREQ</a>.</p> <p><code>stopFrequency</code>, the frequency at which the sweep should reverse direction or return to the start frequency. Range: <a href="#">MIN SIG GEN FREQ</a> to <a href="#">MAX SIG GEN FREQ</a>.</p> <p><code>increment</code>, the amount by which the frequency rises or falls every <code>dwellTime</code> seconds in sweep mode.</p>	PS4000_SINE	sine wave	PS4000_SQUARE	square wave	PS4000_TRIANGLE	triangle wave	PS4000_RAMP_UP	rising sawtooth	PS4000_RAMP_DOWN	falling sawtooth	PS4000_SINC	sin(x)/x	PS4000_GAUSSIAN	normal distribution	PS4000_HALF_SINE	full-wave rectified sinusoid	PS4000_DC_VOLTAGE	DC voltage	PS4000_WHITE_NOISE	random values
PS4000_SINE	sine wave																				
PS4000_SQUARE	square wave																				
PS4000_TRIANGLE	triangle wave																				
PS4000_RAMP_UP	rising sawtooth																				
PS4000_RAMP_DOWN	falling sawtooth																				
PS4000_SINC	sin(x)/x																				
PS4000_GAUSSIAN	normal distribution																				
PS4000_HALF_SINE	full-wave rectified sinusoid																				
PS4000_DC_VOLTAGE	DC voltage																				
PS4000_WHITE_NOISE	random values																				

	<p><code>dwellTime</code>, the time in seconds between frequency changes in sweep mode.</p> <p><code>sweepType</code>, see <a href="#">ps4000SetSigGenArbitrary</a></p> <p><code>operationType</code>, see <a href="#">ps4000SetSigGenArbitrary</a></p> <p><code>shots</code>, see <a href="#">ps4000SigGenArbitrary</a></p> <p><code>sweeps</code>, see <a href="#">ps4000SigGenArbitrary</a></p> <p><code>triggerType</code>, see <a href="#">ps4000SigGenArbitrary</a></p> <p><code>triggerSource</code>, see <a href="#">ps4000SigGenArbitrary</a></p> <p><code>extInThreshold</code>, see <a href="#">ps4000SigGenArbitrary</a></p>
<b>Returns</b>	<p>0: if successful.</p> <p>Error code: if failed.</p>

## 3.10.52 ps4000SetSimpleTrigger

```

PICO_STATUS ps4000SetSimpleTrigger
(
    int16_t          handle,
    int16_t          enable,
    PS4000\_CHANNEL   source,
    int16_t          threshold,
    THRESHOLD\_DIRECTION direction,
    uint32_t         delay,
    int16_t          autoTrigger_ms
)

```

This function simplifies arming the trigger. It supports only the LEVEL trigger types and does not allow more than one channel to have a trigger applied to it. Any previous pulse width qualifier is cancelled.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><i>handle</i>, the handle of the required device.</p> <p><i>enabled</i>, zero to disable the trigger, any non-zero value to set the trigger.</p> <p><i>source</i>, the channel on which to trigger.</p> <p><i>threshold</i>, the ADC count at which the trigger will fire.</p> <p><i>direction</i>, the direction in which the signal must move to cause a trigger. The following directions are supported: ABOVE, BELOW, RISING, FALLING and RISING_OR_FALLING.</p> <p><i>delay</i>, the time, in sample periods, between the trigger occurring and the first sample being taken.</p> <p><i>autoTrigger_ms</i>, the number of milliseconds the device will wait if no trigger occurs.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK PICO_DRIVER_FUNCTION

## 3.10.53 ps4000SetTriggerChannelConditions

```

PICO_STATUS ps4000SetTriggerChannelConditions
(
    int16_t          handle,
    TRIGGER_CONDITIONS * conditions,
    int16_t          nConditions
)

```

This function sets up trigger conditions on the scope's inputs. The trigger is set up by defining one or more [TRIGGER\\_CONDITIONS](#) structures that are then ORed together. Each structure is itself the AND of the states of one or more of the inputs. This AND-OR logic allows you to create any possible Boolean function of the scope's inputs.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>conditions</code>, a pointer to an array of <a href="#">TRIGGER_CONDITIONS</a> structures specifying the conditions that should be applied to each channel. In the simplest case, the array consists of a single element. When there are several elements, the overall trigger condition is the logical OR of all the elements.</p> <p><code>nConditions</code>, the number of elements in the <code>conditions</code> array. If <code>nConditions</code> is zero then triggering is switched off.</p>
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK PICO_CONDITIONS PICO_MEMORY_FAIL

## 3.10.53.1 TRIGGER\_CONDITIONS structure

A structure of this type is passed to [ps4000SetTriggerChannelConditions](#) in the `conditions` argument to specify the trigger conditions, and is defined as follows: -

```
typedef struct tTriggerConditions
{
    TRIGGER_STATE channelA;
    TRIGGER_STATE channelB;
    TRIGGER_STATE channelC;
    TRIGGER_STATE channelD;
    TRIGGER_STATE external;
    TRIGGER_STATE aux;
    TRIGGER_STATE pulseWidthQualifier;
} TRIGGER_CONDITIONS
```

Each structure is the logical AND of the states of the scope's inputs. The [ps4000SetTriggerChannelConditions](#) function can OR together a number of these structures to produce the final trigger condition, which can be any possible Boolean function of the scope's inputs.

<b>Elements</b>	<p><code>channelA</code>, <code>channelB</code>, <code>channelC</code>, <code>channelD</code>, <code>external</code>, <code>pulseWidthQualifier</code>, the type of condition that should be applied to each channel. Use these constants: -</p> <pre>CONDITION_DONT_CARE CONDITION_TRUE CONDITION_FALSE</pre> <p>The channels that are set to <code>CONDITION_TRUE</code> or <code>CONDITION_FALSE</code> must all meet their conditions simultaneously to produce a trigger. Channels set to <code>CONDITION_DONT_CARE</code> are ignored.</p> <p><code>aux</code>, not used</p>
-----------------	--

## 3.10.54 ps4000SetTriggerChannelDirections

```

PICO_STATUS ps4000SetTriggerChannelDirections
(
    int16_t          handle,
    THRESHOLD_DIRECTION channelA,
    THRESHOLD_DIRECTION channelB,
    THRESHOLD_DIRECTION channelC,
    THRESHOLD_DIRECTION channelD,
    THRESHOLD_DIRECTION ext,
    THRESHOLD_DIRECTION aux
)

```

This function sets the direction of the trigger for each channel.

<b>Applicability</b>	All modes.
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>channelA</code>, <code>channelB</code>, <code>channelC</code>, <code>channelD</code>, <code>ext</code> all specify the direction in which the signal must pass through the threshold to activate the trigger. See the <a href="#">table</a> below.</p> <p><code>aux</code>, not used</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_USER_CALLBACK</p> <p>PICO_INVALID_PARAMETER</p>

**Trigger direction constants**

Constant	Type	Direction
ABOVE	gated	above the upper threshold
ABOVE_LOWER	gated	above the lower threshold
BELOW	gated	below the upper threshold
BELOW_LOWER	gated	below the lower threshold
RISING	threshold	rising edge, using upper threshold
RISING_LOWER	threshold	rising edge, using lower threshold
FALLING	threshold	falling edge, using upper threshold
FALLING_LOWER	threshold	falling edge, using lower threshold
RISING_OR_FALLING	threshold	either edge
INSIDE	window-qualified	inside window
OUTSIDE	window-qualified	outside window
ENTER	window	entering the window
EXIT	window	leaving the window
ENTER_OR_EXIT	window	either entering or leaving the window
POSITIVE_RUNT	window-qualified	entering and leaving from below
NEGATIVE_RUNT	window-qualified	entering and leaving from above
NONE	none	none

## 3.10.55 ps4000SetTriggerChannelProperties

```

PICO STATUS ps4000SetTriggerChannelProperties
(
    int16_t          handle,
    TRIGGER_CHANNEL_PROPERTIES * channelProperties
    int16_t          nChannelProperties
    int16_t          auxOutputEnable,
    int32_t          autoTriggerMilliseconds
)

```

This function is used to enable or disable triggering and set its parameters.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device.</p> <p><code>channelProperties</code>, a pointer to an array of <a href="#">TRIGGER_CHANNEL_PROPERTIES</a> structures describing the requested properties. The array can contain a single element describing the properties of one channel, or a number of elements describing several channels. If <code>null</code> is passed, triggering is switched off.</p> <p><code>nChannelProperties</code>, the size of the <code>channelProperties</code> array. If zero, triggering is switched off.</p> <p><code>auxOutputEnable</code>, not used</p> <p><code>autoTriggerMilliseconds</code>, the time in milliseconds for which the scope device will wait before collecting data if no trigger event occurs. If this is set to zero, the scope device will wait indefinitely for a trigger.</p>
<b>Returns</b>	<p>PICO_OK  PICO_INVALID_HANDLE  PICO_USER_CALLBACK  PICO_TRIGGER_ERROR  PICO_MEMORY_FAIL  PICO_INVALID_TRIGGER_PROPERTY</p>

## 3.10.55.1 TRIGGER\_CHANNEL\_PROPERTIES structure

A structure of this type is passed to [ps4000SetTriggerChannelProperties](#) in the `channelProperties` argument to specify the trigger mechanism, and is defined as follows: -

```
typedef struct tTriggerChannelProperties
{
    int16_t          thresholdUpper;
    uint16_t         thresholdUpperHysteresis;
    int16_t          thresholdLower;
    uint16_t         thresholdLowerHysteresis;
    PS4000\_CHANNEL  channel;
    THRESHOLD\_MODE thresholdMode;
} TRIGGER_CHANNEL_PROPERTIES
```

Elements	
	<p><code>thresholdUpper</code>, the upper threshold at which the trigger must fire. This is scaled in 16-bit <a href="#">ADC counts</a> at the currently selected range for that channel.</p>
	<p><code>thresholdUpperHysteresis</code>, the hysteresis by which the trigger must exceed the upper threshold before it will fire. It is scaled in 16-bit counts.</p>
	<p><code>thresholdLower</code>, the lower threshold at which the trigger must fire. This is scaled in 16-bit <a href="#">ADC counts</a> at the currently selected range for that channel.</p>
	<p><code>thresholdLowerHysteresis</code>, the hysteresis by which the trigger must exceed the lower threshold before it will fire. It is scaled in 16-bit counts.</p>
	<p><code>channel</code>, the channel to which the properties apply. See <a href="#">ps4000SetChannel</a> for possible values.</p>
	<p><code>thresholdMode</code>, either a level or window trigger. Use one of these constants: -</p> <ul style="list-style-type: none"> <li>LEVEL</li> <li>WINDOW</li> </ul>

## 3.10.56 ps4000SetTriggerDelay

```

PICO_STATUS ps4000SetTriggerDelay
(
    int16_t handle,
    uint32_t delay
)

```

This function sets the post-trigger delay, which causes capture to start a defined time after the trigger event.

<b>Applicability</b>	All modes
<b>Arguments</b>	<p><code>handle</code>, the handle of the required device</p> <p><code>delay</code>, the time between the trigger occurring and the first sample, in sample periods. For example, if <code>delay=100</code> then the scope would wait 100 sample periods before sampling. Example: with the PicoScope 4224, at a <a href="#">timebase</a> of 80 MS/s, or 12.5 ns per sample (<code>timebase=0</code>) the total delay would then be 100 x 12.5 ns = 1.25 <math>\mu</math>s.</p>
<b>Returns</b>	<p>PICO_OK</p> <p>PICO_INVALID_HANDLE</p> <p>PICO_USER_CALLBACK</p>

## 3.10.57 ps4000SigGenSoftwareControl

```

PICO_STATUS ps4000SigGenSoftwareControl
(
    int16_t    handle,
    int16_t    state
)

```

This function causes a trigger event, or starts and stops gating. It is used when the signal generator is set to [SIGGEN\\_SOFT\\_TRIG](#).

<b>Applicability</b>	Use with <a href="#">ps4000SetSigGenBuiltIn</a> or <a href="#">ps4000SetSigGenArbitrary</a> .
<b>Arguments</b>	<code>handle</code> , the handle of the required device  <code>state</code> , sets the trigger gate high or low when the trigger type is set to either <code>SIGGEN_GATE_HIGH</code> or <code>SIGGEN_GATE_LOW</code> . Ignored for other trigger types.
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_NO_SIGNAL_GENERATOR PICO_SIGGEN_TRIGGER_SOURCE

## 3.10.58 ps4000Stop

```
PICO_STATUS ps4000Stop  
(  
    int16_t handle  
)
```

This function stops the scope device from sampling data. If this function is called before a trigger event occurs, the oscilloscope may not contain valid data.

Always call this function after the end of a capture to ensure that the scope is ready for the next capture.

<b>Applicability</b>	All modes
<b>Arguments</b>	<code>handle</code> , the handle of the required device.
<b>Returns</b>	PICO_OK PICO_INVALID_HANDLE PICO_USER_CALLBACK

## 3.10.59 ps4000StreamingReady

```
typedef void (CALLBACK *ps4000StreamingReady)
(
    int16_t      handle,
    int32_t      noOfSamples,
    uint32_t     startIndex,
    int16_t      overflow,
    uint32_t     triggerAt,
    int16_t      triggered,
    int16_t      autoStop,
    void         * pParameter
)
```

This [callback](#) function is part of your application. You register it with the PicoScope 4000 Series driver using [ps4000GetStreamingLatestValues](#), and the driver calls it back when streaming-mode data is ready. You can then download the data using the [ps4000GetValuesAsync](#) function.

<b>Applicability</b>	<a href="#">Streaming mode</a> only
<b>Arguments</b>	<p><code>handle</code>, the handle of the device returning the samples.</p> <p><code>noOfSamples</code>, the number of samples to collect.</p> <p><code>startIndex</code>, an index to the first valid sample in the buffer. This is the buffer that was previously passed to <a href="#">ps4000SetDataBuffer</a>.</p> <p><code>overflow</code>, returns a set of flags that indicate whether an overvoltage has occurred on any of the channels. It is a bit pattern with bit 0 corresponding to Channel A and so on.</p> <p><code>triggerAt</code>, an index to the buffer indicating the location of the trigger point relative to <code>startIndex</code>. This parameter is valid only when <code>triggered</code> is non-zero.</p> <p><code>triggered</code>, a flag indicating whether a trigger occurred. If non-zero, a trigger occurred at the location indicated by <code>triggerAt</code>.</p> <p><code>autoStop</code>, the flag that was set in the call to <a href="#">ps4000RunStreaming</a>.</p> <p><code>pParameter</code>, a void pointer passed from <a href="#">ps4000GetStreamingLatestValues</a>. The callback function can write to this location to send any data, such as a status flag, back to the application.</p>
<b>Returns</b>	nothing

### 3.11 Enumerated types and constants

The following types and constants are defined in the file `ps4000Api.h`, which is included in the SDK.

```

#define PS4000_MAX_OVERSAMPLE_12BIT    16
#define PS4000_MAX_OVERSAMPLE_8BIT    256

#define PS4XXX_MAX_ETS_CYCLES          400
#define PS4XXX_MAX_INTERLEAVE          80

#define PS4000_MAX_VALUE                32764
#define PS4000_MIN_VALUE                -32764
#define PS4000_LOST_DATA                -32768

#define PS4262_MAX_VALUE                32767
#define PS4262_MIN_VALUE                -32767

#define PS4000_EXT_MAX_VALUE            32767
#define PS4000_EXT_MIN_VALUE            -32767

#define MAX_PULSE_WIDTH_QUALIFIER_COUNT 16777215L

### 3.12 Driver error codes

This description of the **driver error codes** is aimed at those people who intend to write their own programs for use with the driver. Every function in the `ps4000.dll` driver returns an error code from the following list of `PICO_STATUS` values. They are declared in the `picoStatus.h` header file supplied with the SDK.

Code (hex)	Enum
00	<code>PICO_OK</code> . The PicoScope 4000 is functioning correctly.
01	<code>PICO_MAX_UNITS_OPENED</code> . An attempt has been made to open more than <code>PS4000_MAX_UNITS</code> . (Reserved)
02	<code>PICO_MEMORY_FAIL</code> . Not enough memory could be allocated on the host machine.
03	<code>PICO_NOT_FOUND</code> . No PicoScope 4000 could be found.
04	<code>PICO_FW_FAIL</code> . Unable to download firmware.
05	<code>PICO_OPEN_OPERATION_IN_PROGRESS</code> . The driver is busy opening a device.
06	<code>PICO_OPERATION_FAILED</code> . An unspecified error occurred.
07	<code>PICO_NOT_RESPONDING</code> . The PicoScope 4000 is not responding to commands from the PC.
08	<code>PICO_CONFIG_FAIL</code> . The configuration information in the PicoScope 4000 has become corrupt or is missing.
09	<code>PICO_KERNEL_DRIVER_TOO_OLD</code> . The <code>picopp.sys</code> file is too old to be used with the device driver.
0A	<code>PICO_EEPROM_CORRUPT</code> . The EEPROM has become corrupt, so the device will use a default setting.
0B	<code>PICO_OS_NOT_SUPPORTED</code> . The operating system on the PC is not supported by this driver.
0C	<code>PICO_INVALID_HANDLE</code> . There is no device with the handle value passed.
0D	<code>PICO_INVALID_PARAMETER</code> . A parameter value is not valid.
0E	<code>PICO_INVALID_TIMEBASE</code> . The time base is not supported or is invalid.
0F	<code>PICO_INVALID_VOLTAGE_RANGE</code> . The voltage range is not supported or is invalid.
10	<code>PICO_INVALID_CHANNEL</code> . The channel number is not valid on this device or no channels have been set.
11	<code>PICO_INVALID_TRIGGER_CHANNEL</code> . The channel set for a trigger is not available on this device.
12	<code>PICO_INVALID_CONDITION_CHANNEL</code> . The channel set for a condition is not available on this device.
13	<code>PICO_NO_SIGNAL_GENERATOR</code> . The device does not have a signal generator.
14	<code>PICO_STREAMING_FAILED</code> . Streaming has failed to start or has stopped without user request.
15	<code>PICO_BLOCK_MODE_FAILED</code> . Block failed to start - a parameter may have been set wrongly.
16	<code>PICO_NULL_PARAMETER</code> . A parameter that was required is <code>NULL</code> .
17	<code>PICO_ETS_MODE_SET</code> . The function call failed because <a href="#">ETS</a> mode is being used.
18	<code>PICO_DATA_NOT_AVAILABLE</code> . No data is available from a run block call.
19	<code>PICO_STRING_BUFFER_TOO_SMALL</code> . The buffer passed was too small for the string to be returned.
1A	<code>PICO_ETS_NOT_SUPPORTED</code> . <a href="#">ETS</a> is not supported on this device variant.
1B	<code>PICO_AUTO_TRIGGER_TIME_TOO_SHORT</code> . The auto trigger time is less than the time it will take to collect the data.
1C	<code>PICO_BUFFER_STALL</code> . The collection of data has stalled as unread data would be overwritten.
1D	<code>PICO_TOO_MANY_SAMPLES</code> . Number of samples requested is more than available in the current memory segment.

1E	PICO_TOO_MANY_SEGMENTS. Not possible to create number of segments requested.
1F	PICO_PULSE_WIDTH_QUALIFIER. A null pointer has been passed in the trigger function or one of the parameters is out of range.
20	PICO_DELAY. One or more of the hold-off parameters are out of range.
21	PICO_SOURCE_DETAILS. One or more of the source details are incorrect.
22	PICO_CONDITIONS. One or more of the conditions are incorrect.
23	PICO_USER_CALLBACK. The driver's thread is currently in the <a href="#">ps4000...Ready</a> callback function and therefore the action cannot be carried out.
24	PICO_DEVICE_SAMPLING. An attempt is being made to get stored data while streaming. Either stop streaming by calling <a href="#">ps4000Stop</a> , or use <a href="#">ps4000GetStreamingLatestValues</a> .
25	PICO_NO_SAMPLES_AVAILABLE. ...because a run has not been completed.
26	PICO_SEGMENT_OUT_OF_RANGE. The memory index is out of range.
27	PICO_BUSY. The driver cannot return data yet.
28	PICO_STARTINDEX_INVALID. The start time to get stored data is out of range.
29	PICO_INVALID_INFO. The information number requested is not a valid number.
2A	PICO_INFO_UNAVAILABLE. The handle is invalid so no information is available about the device. Only PICO_DRIVER_VERSION is available.
2B	PICO_INVALID_SAMPLE_INTERVAL. The sample interval selected for streaming is out of range.
2C	PICO_TRIGGER_ERROR. ETS is set but no trigger has been set. A trigger setting is required for ETS.
2D	PICO_MEMORY. Driver cannot allocate memory
2E	PICO_SIG_GEN_PARAM. Error in signal generator parameter
2F	PICO_SHOTS_SWEEPS_WARNING. The signal generator will output the signal required but sweeps and shots will be ignored. Only one parameter can be non-zero.
30	PICO_SIGGEN_TRIGGER_SOURCE. A software trigger has been sent but the trigger source is not a software trigger.
31	PICO_AUX_OUTPUT_CONFLICT. A <a href="#">ps4000SetTrigger...</a> call has found a conflict between the trigger source and the AUX output enable.
32	PICO_AUX_OUTPUT_ETS_CONFLICT. <a href="#">ETS</a> mode is being used and AUX is set as an input.
33	PICO_WARNING_EXT_THRESHOLD_CONFLICT. The EXT threshold is being set in both a <a href="#">ps4000SetTrigger...</a> function and in the signal generator but the threshold values differ. The last value set will be used.
34	PICO_WARNING_AUX_OUTPUT_CONFLICT. A <a href="#">ps4000SetTrigger...</a> function has set AUX as an output and the signal generator is using it as a trigger.
35	PICO_SIGGEN_OUTPUT_OVER_VOLTAGE. The requested voltage and offset levels combine to give an overvoltage.
36	PICO_DELAY_NULL. NULL pointer passed as delay parameter.
37	PICO_INVALID_BUFFER. The buffers for overview data have not been set while streaming.
38	PICO_SIGGEN_OFFSET_VOLTAGE. The signal generator offset voltage is higher than allowed.
39	PICO_SIGGEN_PK_TO_PK. The signal generator peak-to-peak voltage is higher than allowed.
3A	PICO_CANCELLED. A block collection has been cancelled.
3B	PICO_SEGMENT_NOT_USED. The specified segment index is not in use.
3C	PICO_INVALID_CALL. The wrong <a href="#">GetValues</a> function has been called for the collection mode in use.
3D	PICO_GET_VALUES_INTERRUPTED
3F	PICO_NOT_USED. The function is not available.

40	PICO_INVALID_SAMPLERATIO. The <a href="#">aggregation</a> ratio requested is out of range.
41	PICO_INVALID_STATE. Device is in an invalid state.
42	PICO_NOT_ENOUGH_SEGMENTS. The number of segments allocated is fewer than the number of captures requested.
43	PICO_DRIVER_FUNCTION. You called a driver function while another driver function was still being processed.
44	PICO_RESERVED
45	PICO_INVALID_COUPLING. The dc argument passed to <a href="#">ps4000SetChannel</a> was invalid.
46	PICO_BUFFERS_NOT_SET. Memory buffers were not set up before calling one of the <a href="#">ps4000Run...</a> functions.
47	PICO_RATIO_MODE_NOT_SUPPORTED. <a href="#">downSampleRatioMode</a> is not valid for the connected device.
48	PICO_RAPID_NOT_SUPPORT_AGGREGATION. Aggregation was requested in <a href="#">rapid block mode</a> .
49	PICO_INVALID_TRIGGER_PROPERTY. An incorrect value was passed to <a href="#">ps4000SetTriggerChannelProperties</a> .

*picoStatus.h revision 1.36, 8/9/2011*

### 3.13 Programming examples

Your PicoScope installation includes programming examples in the following languages and development environments:

- [C](#)
- [Excel](#)
- [LabView](#)

#### 3.13.1 C

The SDK includes a console-mode program (`ps4000con.c`) that demonstrates how to use the PicoScope 4000 driver in Windows. The program demonstrates the following procedures:

- Open a PicoScope 4000 oscilloscope
- Collect a block of samples immediately
- Collect a block of samples when a trigger event occurs
- Collect a stream of data immediately
- Collect a stream of data when a trigger event occurs

To build this application:

- Set up a project for a 32-bit console mode application
- Add `ps4000con.c` to the project
- Add `ps4000.lib` to the project (Microsoft C only)
- Add `ps4000Api.h` and `picoStatus.h` to the project
- Build the project

#### 3.13.2 Excel

The Excel example demonstrates how to capture data in Excel from a PicoScope 4000 Series scope.

1. Copy the following files from the SDK to a location that is on your Windows execution path (for example, `C:\windows\system32`):

- `ps4000wrap.dll`
- `ps4000.dll`
- `PicoIpp.dll`

2. Load the spreadsheet `ps4000.xls`
3. Select **Tools > Macro**
4. Select **GetData**
5. Select **Run**

Note: The Excel macro language is similar to Visual Basic. The functions which return a `TRUE/FALSE` value, return 0 for `FALSE` and 1 for `TRUE`, whereas Visual Basic expects 65 535 for `TRUE`. Check for `>0` rather than `=TRUE`.

### 3.13.3 LabVIEW

The SDK contains a library of VIs that can be used to control the PicoScope 4000 and some simple examples of using these VIs in [streaming mode](#), [block mode](#) and [rapid block mode](#).

The LabVIEW library (`PicoScope4000.llb`) can be placed in the `user.lib` sub-directory to make the VIs available on the 'User Libraries' palette. You must also copy `ps4000.dll` and `ps4000wrap.dll` to the folder containing your LabView project.

The library contains the following VIs:

- `PicoErrorHandler.vi` - takes an error cluster and, if an error has occurred, displays a message box indicating the source of the error and the status code returned by the driver
- `PicoScope4000AdvancedTriggerSettings.vi` - an interface for the advanced trigger features of the oscilloscope

This VI is not required for setting up simple triggers, which are configured using `PicoScope4000Settings.vi`.

For further information on these trigger settings, see descriptions of the trigger functions:

```
ps4000SetTriggerChannelConditions
ps4000SetTriggerChannelDirections
ps4000SetTriggerChannelProperties
ps4000SetPulseWidthQualifier
ps4000SetTriggerDelay
```

- `PicoScope4000AWG.vi` - controls the arbitrary waveform generator

Standard waveforms or an arbitrary waveform can be selected under 'Wave Type'. There are three settings clusters: general settings that apply to both arbitrary and standard waveforms, settings that apply only to standard waveforms and settings that apply only to arbitrary waveforms. It is not necessary to connect all of these clusters if only using arbitrary waveforms or only using standard waveforms.

When selecting an arbitrary waveform, it is necessary to specify a text file containing the waveform. This text file should have a single value on each line in the range -1 to 1. For further information on the settings, see descriptions of `ps4000SetSigGenBuiltIn` and `ps4000SetSigGenArbitrary`.

- `PicoScope4000Close.vi` - closes the oscilloscope

Should be called before exiting an application.

- `PicoScope4000GetBlock.vi` - collects a block of data from the oscilloscope

This can be called in a loop in order to continually collect blocks of data. The oscilloscope should first be set up by using `PicoScope4000Settings.vi`. The VI outputs data arrays in two clusters (max and min). If not using aggregation, 'Min Buffers' is not used.

- `PicoScope4000GetRapidBlock.vi` - collects a set of data blocks or captures from the oscilloscope in [rapid block mode](#)

This VI is similar to `PicoScope4000GetBlock.vi`. It outputs two-dimensional arrays for each channel that contain data from all the requested number of captures.

- `PicoScope4000GetStreamingValues.vi` - used in [streaming mode](#) to get the latest values from the driver

This VI should be called in a loop after the oscilloscope has been set up using `PicoScope4000Settings.vi` and streaming has been started by calling `PicoScope4000StartStreaming.vi`. The VI outputs the number of samples available and the start index of these samples in the array output by `PicoScope4000StartStreaming.vi`.

- `PicoScope4000Open.vi` - opens a PicoScope 4000 and returns a handle to the device
- `PicoScope4000Settings.vi` - sets up the oscilloscope

The inputs are clusters for setting up channels and simple triggers. Advanced triggers can be set up using `PicoScope4000AdvancedTriggerSettings.vi`.

- `PicoScope4000StartStreaming.vi` - starts the oscilloscope [streaming](#)

It outputs arrays that will contain samples once `PicoScope4000GetStreamingValues.vi` has returned.

- `PicoStatus.vi` - checks the status value returned by calls to the driver

If the driver returns an error, the status member of the error cluster is set to 'true' and the error code and source are set.

## 4 Glossary

**AC/DC switch.** To switch from AC coupling to DC coupling, or vice versa, select AC or DC from the control on the PicoScope toolbar. The AC setting filters out very low-frequency components of the input signal, including DC, and is suitable for viewing small AC signals superimposed on a DC or slowly changing offset. In this mode you can measure the peak-to-peak amplitude of an AC signal but not its absolute value. Use the DC setting for measuring the absolute value of a signal.

**ADC.** Analog-to-digital converter. The electronic component in a PC oscilloscope that converts analog signals from the inputs into digital data suitable for transmission to the PC.

**Aggregation.** The [PicoScope 4000](#) driver can use this method to reduce the amount of data your application needs to process. This means that for every block of consecutive samples, it stores only the minimum and maximum values. You can set the number of samples in each block, called the aggregation parameter, when you call [PS4000RunStreaming](#) for real-time capture, and when you call [ps4000GetStreamingLatestValues](#) to obtain post-processed data.

**Block mode.** A sampling mode in which the computer prompts the oscilloscope to collect a block of data into its internal memory before stopping the oscilloscope and transferring the whole block into computer memory. Choose this mode of operation when the input signal being sampled contains high frequencies. Note: To avoid sampling errors, the maximum input frequency must be less than half the sampling rate.

**Buffer size.** The size of the oscilloscope buffer memory, measured in samples. The buffer allows the oscilloscope to sample data faster than it can transfer it to the computer.

**Callback.** A mechanism that the PicoScope 4000 driver uses to communicate asynchronously with your application. At design time, you add a function (a *callback* function) to your application to deal with captured data. At run time, when you request captured data from the driver, you also pass it a pointer to your function. The driver then returns control to your application, allowing it to perform other tasks until the data is ready. When this happens, the driver calls your function in a new thread to signal that the data is ready. It is then up to your function to communicate this fact to the rest of your application.

**Device Manager.** Device Manager is a Windows program that displays the current hardware configuration of your computer. On Windows XP, Vista or 7, right-click **My Computer**, choose **Properties**, then click the **Hardware** tab and the **Device Manager** button. In Windows 8 it is directly accessible from the **Start** menu.

**Driver.** A program that controls a piece of hardware. The driver for the PicoScope 4000 Series PC Oscilloscopes is supplied in the form of a 32-bit Windows DLL, [ps4000.dll](#). This is used by the PicoScope software, and by user-designed applications, to control the oscilloscopes.

**ETS.** Equivalent-time sampling. A technique for increasing the effective sampling rate of an oscilloscope beyond the maximum sampling rate of its ADC. The scope triggers on successive cycles of a repetitive waveform and collects one sample from each cycle. Each sample is delayed relative to the trigger by a time that increases with each cycle, so that after a number of cycles a complete period of the waveform has been sampled. The waveform must be stable and repetitive for this method to work.

**GS/s.** Gigasample (billion samples) per second.

**IEPE.** Integrated Electronics Piezoelectric. A standard for accelerometers and other piezoelectric sensors that require an external power supply. Special IEPE-enabled PicoScope 4000 Series scopes have a phantom-powered input that supports these sensors.

**Maximum sampling rate.** A figure indicating the maximum number of samples the oscilloscope can acquire per second. The higher the sampling rate of the oscilloscope, the more accurate the representation of the high-frequency details in a fast signal.

**MS/s.** Megasample (million samples) per second.

**Oversampling.** Oversampling is taking measurements more frequently than the requested sample rate, and then combining them to produce the required number of samples. If, as is usually the case, the signal contains a small amount of noise, this technique can increase the effective [vertical resolution](#) of the oscilloscope.

**PC Oscilloscope.** A virtual instrument formed by connecting a PicoScope 4000 Series scope unit to a computer running the PicoScope software.

**PicoScope 4000 Series.** A range of high-resolution PC Oscilloscopes from Pico Technology. The range includes two-channel and four-channel models, with or without a built-in function generator and arbitrary waveform generator.

**PicoScope software.** A software product that accompanies all Pico PC Oscilloscopes. It turns your PC into an oscilloscope, spectrum analyser, and meter display.

**Streaming mode.** A sampling mode in which the oscilloscope samples data and returns it to the computer in an unbroken stream. This mode allows the capture of data sets whose size is not limited by the size of the scope's memory buffer, at sampling rates up to 6.6 million samples per second.

**Timebase.** The timebase controls the time interval that each horizontal division of a scope view represents. There are ten divisions across the scope view, so the total time across the view is ten times the timebase per division.

**Trigger bandwidth.** The external trigger input is less sensitive to very high-frequency input signals than to low-frequency signals. The trigger bandwidth is the frequency at which a trigger signal will be attenuated by 3 decibels.

**USB 1.1.** Universal Serial Bus (Full Speed). This is a standard port used to connect external devices to PCs. A typical USB 1.1 port supports a data transfer rate of 12 megabits per second, so is much faster than an RS232 COM port.

**USB 2.0.** Universal Serial Bus (High Speed). This is a standard port used to connect external devices to PCs. A typical USB 2.0 port supports a data transfer rate 40 times faster than USB 1.1 when used with a USB 2.0 device, but can also be used with USB 1.1 devices.

**Vertical resolution.** A value, in bits, indicating the precision with which the oscilloscope converts input voltages to digital values. [Oversampling](#) (see above) can improve the effective vertical resolution.

**Voltage range.** The range of input voltages that the oscilloscope can measure. For example, a voltage range of  $\pm 100$  mV means that the oscilloscope can measure voltages between  $-100$  mV and  $+100$  mV. Input voltages outside this range will not damage the instrument as long as they remain within the protection limits of  $\pm 200$  V.
