

Electric Trolley for interactive monitors

TR-TTI

Designed for tables and interactive monitors, the trolley is height- and tilt-adjustable via remote control. It offers many application options. For example, combined with a surface made from glass or other material, an interactive ultra-short throw projector and a Notebook PC, the trolley becomes an interactive lectern and/or table. Or you can combine it with a Notebook PC and a 42- to 84-inch touch screen monitor to create a lectern or table with touch screen functionality. Includes four lock casters.

The optional side shelf with high-impact edges offers support for a notebook, a document camera, books or other device. Thanks to the trolley's adjustable height and tilt, children as well as disabled and wheelchair users can interact with the surface whatever the solution adopted.
