**Above:** without monitor arms, workspace is crowded and eye-to-eye contact is strained

**Below:** monitor arms free up workspace and allow full line-of-sight functionality and provide healthful sit or stand work conditions

*M*onitor arms are an extremely valuable asset to a presentation setting. Workstations are kept clutter-free, important visual information can be seen ergonomically, and instructors can better interact with audiences throughout a presentation.

Monitor arms allow monitors to “float” above the worksurface and allow a clean, organized and professional-looking workstation. All varieties of Spectrum monitor arms have cleverly placed wiring channels to keep the worksurface clear of cumbersome wires.

A dual articulating design brings ergonomic views of anything the presenter needs to see on a screen. And when an instructor station is used by different presenters throughout the day, a monitor arm is even more important to maintain a comfortable setting for everyone.

Large screens and displays are almost always used to professionally share visual material with audiences. Without a monitor arm, presenters turn their backs on audiences while discussing important visual information. But when using a monitor arm, instructors see the same information while still facing the audience. A genuine connection is made when instructors can see real-time audience reactions to material being presented.

# Monitor Arms

(Pole/Arm and Holder Assembly sold separately)

**95529**  
Pole/Arm

**95530**  
iPad® Holder
