

Changes to ACTIVE.T

Enhanced collision prevention sensor

Change / discontinuation

Delivery: Week 46

The ACTIVE.T workstation system features a hardware-based control-integrated safety shutdown as standard, which enables collision protection by measuring the current consumption.

Note:

In order to decisively detect possible collisions when adjusting the desk height, we recommend an additional, externally installed sensor is provided via the PIZ1 option.

In order to ensure maximum safety at the workplace, the additional sensor is recommended. Due to its improved sensitivity, this sensor significantly increases the safety of the motorised table and detects possible collisions when the table is moved. Damage to the table or the colliding object can thus be considerably reduced.

The price for this option is set at €28.00. The option PIZ1 will be included in the OFML data from Week 46 and can be selected as required.
