

Featured Product for Dec. 1st -31st

Colostrum: nature's first food is your first line of defence

Colostrum is the first pre-milk substance that is produced by the mammary gland of female mammals, and as such is all-natural and ideally suited to humans for the building and strengthening of the immune system and repair of body tissue. Furthermore, colostrum just doesn't support the immune system, but contains its own immune components that defend against invaders.

Nature's most unique 'universal donor' for the immune system.

Colostrum is unique in its combination of immune factors, which not only enhance the performance of the immune system, but add certain immune system components that are found only in colostrum and are not duplicable in medicine. What makes colostrum so beneficial is that it is actually providing its own immune factors to the body and thus enhances the immune system.

Colostrum contains large protein molecules known as immunoglobulins that help defend the body against viruses and bacteria. Colostrum also contains specific antibodies, broad-based immune enhancers, as well as leukocytes that inhibit virus penetration of cellular walls.

Bovine colostrum is known as a "universal donor." Thus humans are able to benefit from it because its immune and growth factors, along with key immunoglobulins, are identical in molecular structure to those of humans. Colostrum provides most of its powerful immune benefits where 80 percent of all disease starts — in the mucosal surfaces of the body — intestines, lungs, sinus, eyes, etc.

Colostrum is the only natural food substance capable of providing immune protection this powerful!

80% of all sickness begins in the mucosal membrane found throughout the body.

As a 'universal donor,' colostrum is unlike any other food. It is loaded with immune factors, protective proteins, and growth factors that humans can fully utilize for the building and repair of body tissue.

Growth factors support healing and regeneration of body tissue through protein synthesis.

The growth factors in colostrum accelerate the healing of soft tissue, muscle, tendon and ligament injuries.

Andrew Keech, Ph.D. and colostrum researcher writes, "Colostrum's growth factors stimulate regeneration and repair of muscle, bone, cartilage, skin, collagen and nerve tissues, as well as RNA and DNA. This not only means faster, more complete recovery from injury and illness. It is also how colostrum stimulates age-erasing effects."

"Colostrum is the perfect food, combining all the crucial immune and growth factors in the exact synergistic combination necessary to promote life."

Nature's Sunshine Colostrum is 100% bovine colostrum. Gathered from cows raised in pristine, humane and sustainable conditions for maximum quality assurance.

- Provides support to the immune system.
- Source of non-essential amino acids involved in protein synthesis.
