

WHY TOP PROFESSIONALS CHOOSE CTi KNEE BRACES FOR SKIING

CTi braces are medical grade products, covered by most insurance plans with a doctor's prescription. Whether custom or off-the-shelf, every CTi ligament brace benefits from the input of medical professionals and feedback from professional skiers. The resulting brace is the perfect blend of support and function, designed to help you rehab and ski safely after a knee injury.

Skiers have unique demands and anatomy. CTi features specific design advantages and/or adjustments that can be made to optimize performance for skiing, including:

- A basic frame design that functions well for skiing. The CTi is the only ligament knee brace that captures the tibia, locking down securely on the tibial crest. The rigid upper and lower arms combine with the hinges, condyle pads and straps to properly align the knee joint and provide an accurately-tracking exoskeletal support.
- The upper portion of the CTi brace frame can be flared out to accommodate larger quads (common among skiers) and to reduce rubbing and bruising when turning, skiing moguls and landing tricks/airs in deep flexion (squat).
- CTi can be ordered with an Anti-Migration System (AMS) at no additional charge. This comfortable neoprene padding configuration virtually eliminates brace slippage, eliminating the annoying hassle of having to constantly adjust your brace under your layers and outerwear.
- CTi has no rigid components across the posterior (back) side of the brace, so you won't experience pinching or cramping when turning, squatting to land a trick/air or sitting on a lift.
- Streamlined frame shape and hinge design (especially on the medial side) contour closely with the leg, allowing you to keep your form tighter.
- CTi can be manufactured to be shorter, longer, thicker or thinner based upon your height and weight.
