

Keter: Journeying into inner space during outer space exploration

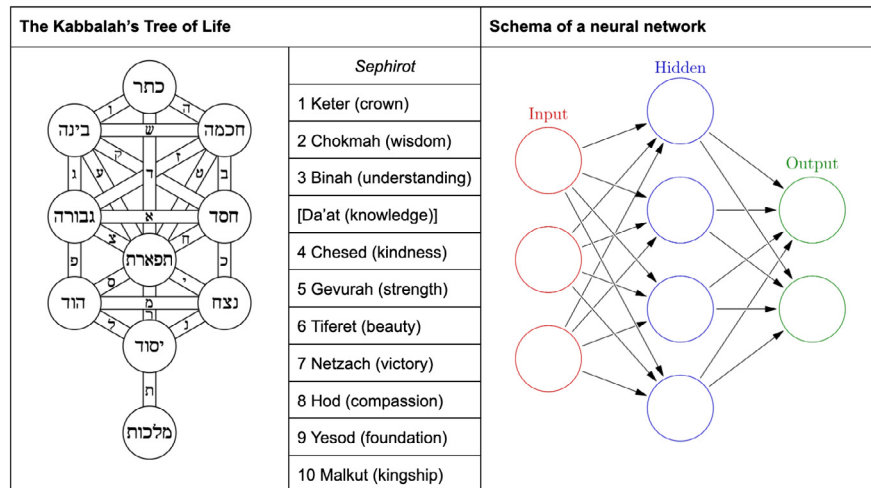

As we wish you *farewell* to explore solar systems, your *welfare* is our priority at Soul Systems.

Our new branding

We are proud to launch, Keter, the branding of our new safety product range. Neural networks are at the core of Soul Systems' products, and Keter draws on the juxtaposition of their schemas and the Tree of Life in the Kabbalah- Judaism's mystical tradition.

The Tree of Life represents the connections between attributes of god's being, and the process by which the universe was created. At its top sits the attribute, Keter ('crown' in Hebrew), that the Kabbalah refers to as 'the most hidden of all hidden things'- out of which all things are created. The hidden layers of neural network nodes, and their representations of the world, are often beyond human comprehension, making them almost mystical.

Kabbalah conceives of consciousness as the way by which creation can reverse its course back up the Tree until it's once again united with Keter. So it's fitting to launch Keter on the eve of exploring the heavens when neuroscience has explained the last piece of the divine jigsaw- the soul.

Keter brings together our three safety products

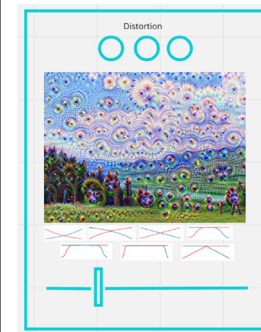

Entropometer

Space travellers undergo gene therapy to splice hibernation genes from bears into their DNA to lower metabolism during long spaceflight. When these genes are switched on and off, the Entropometer allows Mission Control to measure and move space travellers through different levels of consciousness.

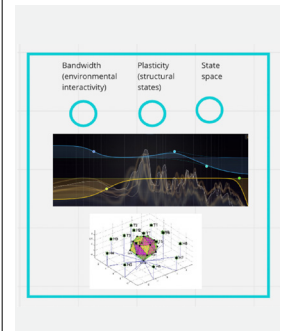

Hallucinator

Moving through different levels of consciousness can induce hallucinations. But hallucinations can inform Mission Control about space travellers' perceptual dissonance which is crucial when syncing brains. The Hallucinator allows Mission Control to simulate the sensory, emotional and cognitive contents of subjective experiences, as well as communicate with hibernating space travellers via direct brain implants.

Embodimonitor

Space hazards mean that space travellers wear a second skin made of AI programmed stem cells- xenobots- that produce therapeutics in real time that are absorbed through the skin. The Embodimonitor allows Mission Control to monitor the conscious selfhood and agency of the xenoskin, imposing fail safe controls when necessary.
