## Singlemode Fiber

### GENERAL DESCRIPTION

R&M<sup>®</sup> offers two kind of standard singlemode fibers for their cables and cords. Customers can choose between an enhanced full-spectrum singlemode fiber known as the ITU-T G.657.A1 fiber. Or then an enhanced low macro bending sensitive fiber also known as an ITU-T G.657.A2/B2 fiber. Please note, today with R&M the G.652.D fiber does not exist as a stand-alone fiber type anymore.

The **G.657.A1** fiber is a an ITU-T Recommendation G652.D compliant optical fiber that exceeds the ITU-T Recommendation G.657.A1 standard and still splices the same as the installed base of standard singlemode fibers. The fiber provides improved performance across the entire wavelength spectrum due to its low attenuation in the 1383 nm water-peak region.

The **G.657.A2/B2** fiber is optimized for a wide array of indoor installations. Its preferred use is in office installations, for patch cords, interconnection cables and for Fiber-to-the-Home networks. The fiber delivers enhanced macro bending performance while maintaining compatibility with current equipment, practices and procedures. The G.657.A2/B2 fiber remains compatible and fully compliant with ITU-T Recommendation G.652.D.

FTTH installation cables, patch cords and buffered fibers with **ITU-T G.657.B3** fiber are also optionally available from R&M. This is an improved singlemode fiber with ultra-low bend sensitivity designed for the challenging use of FTTH applications. R&M uses a G.657.B3 fiber that is compatible and fully compliant with the ITU-T G.652.D fiber.
