

Valor Updater Tool — Overview

Internal Reference

What It Is

The Valor Updater is a tool for existing wired Valor HE and wired Valor TMR controllers that unlocks app compatibility and provides a way to recover or reset the controller if something goes wrong. It serves two primary purposes, outlined below.

Scope: Wired Models Only

The Valor Updater supports the wired Valor Hall Effect (HE) and wired Valor TMR models only. It does not support the Valor Pro wireless model.

1. Enables Valor Companion App Compatibility (Wired Valor HE)

Wired Valor HE controllers did not originally ship with app compatibility. Running the Valor Updater brings the controller up to the point where it can connect to and be used with the Valor Companion App — enabling access to app-based features (such as remapping, profiles, and settings) that were not available on the controller out of the box.

2. Recovery / Reset to Baseline (Wired Valor HE and Wired Valor TMR)

For both wired Valor HE and wired Valor TMR models, the Updater can be used as a recovery tool. If a controller becomes unresponsive, or otherwise runs into issues, running the Updater resets it back to a known-good baseline state.

Summary

Function	Applies To	Outcome
App Compatibility	Wired Valor HE	Controller becomes usable with the Valor Companion App
Reset to Baseline	Wired Valor HE and Wired Valor TMR	Unresponsive or malfunctioning controllers are restored to a working baseline
Not Supported	Valor Pro (wireless)	Updater does not apply to this model
