Safety Information

Important Information

NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a Danger or Warning safety label indicates that an electrical hazard exists, which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER

DANGER indicates an imminently hazardous situation which, if not avoided, **will result in** death or serious injury.

WARNING

WARNING indicates a potentially hazardous situation which, if not avoided, **can result in** death or serious injury.

CAUTION

CAUTION indicates a potentially hazardous situation which, if not avoided, **can result in** minor or moderate injury.

CAUTION

CAUTION, used without the safety alert symbol, indicates a potentially hazardous situation which, if not avoided, **can result in** equipment damage.

PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and the installation, and has received safety training to recognize and avoid the hazards involved.

About the Book

At a Glance

Document Scope

This manual describes the communication variables of the TeSys U motor starters.

Communication variables are grouped according to the following criteria:

- Identification variables
- Statistics variables
- Monitoring variables
- Configuration variables
- Setting variables
- Control variables
- HMI variables

Each variable is described individually (definition, range of values, default value, etc.) and the variable address is provided for each available protocol.

Communication variables are either related to:

- a Power base (LUB**, LU2B**, LUS**, LU2S**), or
- a Controller base (LUTM**).

Available protocols and associated TeSys U communication modules are listed below:

Protocol	TeSys U communication module (LULC**)
Advantys STB	LULC15
CANopen	LULC08
DeviceNet	LULC09
Modbus	LULC032-033
Profibus DP	LULC07

Validity Note

This manual should be used in addition to the specific documentation provided for the communication modules, which may form part of the motor starter. These specific documents should be referred to when setting up hardware and software.

Communication Variables with a TeSys U Power Base

1

Introduction

Communication variables are listed in tables. Each one belongs to a group (such as, identification, statistics, or monitoring) and is associated to a power base with a control unit attached.

The associated TeSys U Power bases can be:

- LUB••
- LU2B••
- LUS••
- LU2S••

What's in this Chapter?

This chapter contains the following topics:

Topic	Page
Table Structure with a TeSys U Power Base	10
Group 1. Identification Variables with a TeSys U Power Base	12
Group 2. Statistics Variables with a TeSys U Power Base	15
Group 3. Monitoring Variables with a TeSys U Power Base	20
Group 4. Configuration Variables with a TeSys U Power Base	26
Group 5. Setting Variables with a TeSys U Power Base	29
Group 6. Control Variables with a TeSys U Power Base	32
Group 7. HMI Monitoring Variables with a TeSys U Power Base	34

Table Structure with a TeSys U Power Base

Table Format (Columns 1-6)

Variables are described in 6-column tables (from left to right):

1. Protocols addresses
2. Object types
3. Description/possible values
4. Control unit: LUCA
5. Control unit: LUCB, LUCC, LUCD
6. Control unit: LUCM

Column 1: Protocols Addresses

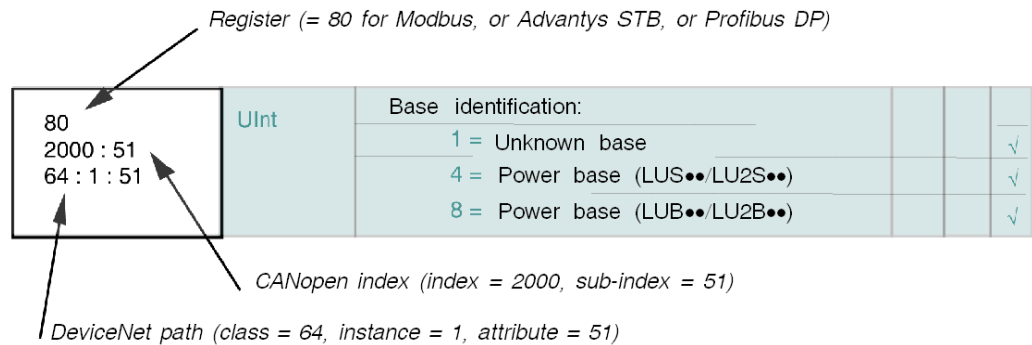

Logic addresses of protocols, for each communication variable, are:

- **Register** (format = decimal)
 - Modbus, with direct addressing.
 - Advantys STB, through PKW addressing.
 - Profibus DP, through PKW or DP V1 cyclic exchange. For Profibus DP V1 Acyclic Data Read/Write, the addressing is done block by block.
- For more information, see *LULC07 Profibus DP Communication Module User Manual*.
- **CANopen index** (format = Index : sub-index), with direct addressing or through PKW.
- **DeviceNet path** (format = Class : instance : attribute), with direct addressing or through PKW

NOTE:

- CANopen mappable objects are identified by the character "M" beside each address.
- Registers marked with a "P" denote Profibus parameters that are automatically transmitted by the master on network connection, if the local configuration is not preserved (that is, bit 601.7 = 0)

Example with variable 80:

Column 2: Object Types

Object types can be:

- **Int**: signed integer using one register (16 bits)
- **UInt**: unsigned integer using one register (16 bits)
- **Word**: Set of 16 bits.

Example with variable 80:

Column 3: Description / Values

The short description of the register can include:

- range of values,
- default value,
- minimum / maximum values.

Example with variable 80:

80 2000 : 51 64 : 1 : 51	UInt	Base identification:			
		1 = Unknown base			✓
		4 = Power base (LUS●●/LU2S●●)			✓
		8 = Power base (LUB●●/LU2B●●)			✓

Possible values = 1, 4, 8

Variable description = Base identification

Columns 4 to 6: Control Units

The three possible Control unit types are:

- Column 4: Standard (LUCA●●)
- Column 5: Advanced (LUCB●●, LUCC●●, LUCD●●)
- Column 6: Multifunction (LUCM●●).

If a feature or function is supported by the control unit, there is a checkmark in the corresponding cell. If not, the cell is empty.

Example with variable 80:

80 2000 : 51 64 : 1 : 51	UInt	Base identification:			
		1 = Unknown base			✓
		4 = Power base (LUS●●/LU2S●●)			✓
		8 = Power base (LUB●●/LU2B●●)			✓

This variable is only supported by a Multifunction Control Unit (LUCM●●)

Group 1. Identification Variables with a TeSys U Power Base

Identification Variables

Group 1 Identification variables are described below.

Identification registers are divided into sub-groups:

- Module identification
- Control unit identification
- Base identification
- Current range

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCA	LUCB/C/D	LUCM

Group 3. Monitoring Variables with a TeSys U Power Base

Monitoring Variables

Group 3 Monitoring variables are described below.

Monitoring registers are divided into sub-groups:

- Monitoring of faults
- Monitoring of status
- Monitoring of communication module status
- Monitoring of warnings
- Monitoring of measurements

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCA	LUCB/C/D	LUCM
Monitoring of faults - Read only					
450 2004 : 01 M 68 : 1 : 01	UInt	Time to automatically reset on a thermal fault (s)			√

41	461.11 (Internal temperature warning)			√
42	461.12 (Module identification or internal communication warning)			√
43-44	<i>(Reserved)</i>			
45	461.15 (Module warning)	√	√	√

Group 6. Control Variables with a TeSys U Power Base

Control Variables

Group 6 Control variables are described below.

Control registers are divided into sub-groups:

- Control of the communication module
- Control of the system and control unit

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCA	LUCB/C/D	LUCM
Control of the communication module - Read / Write					
700 2008 : 01 M 6C : 1 : 01	Word	Output control:			
	bit 0	Control of output LO1 (if 685=2)	√	√	√
	bit 1	Control of output OA1 (if 686 LSB=2)	√	√	√
	bit 2	Control of output OA3 (if 686 MSB=2)	√	√	√
	bits 3-15	(Reserved)			
703 2008 : 04 M 6C : 1 : 04	Word	Control of communication module:			
	bits 0-2	(Reserved)			
	bit 3	Reset warning (for example, communication loss)	√	√	√
	bits 4-15	(Reserved)			

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCA	LUCB/C/D	LUCM
Control of the system and control unit - Read / Write					
704 2008 : 05 M 6C : 1 : 05	Word	Control of the system:			
	bit 0	Run forward	√	√	√
	bit 1	Run reverse	√	√	√
	bit 2	(Reserved)			
	bit 3	Fault reset: if register 451=102 or 104, fault acknowledgment causes a return to communication module factory settings	√	√	√
	bit 4	(Reserved)			
	bit 5	Launch automatic thermal overload fault test: This test simulates a thermal overload. Bit 9 of Fault register 452 is set to 1 indicating "Test trip fault" and bit 3 of Warning register 461 is set to 1 indicating "Thermal warning".			√
	bits 6-11	(Reserved)			
	bit 12	Launch trip test via communication bus This test simulates a short circuit. Bit 8 of Fault register 452 is set to 1 indicating "Shunt trip fault".			√
bits 13-15	(Reserved)				
705 2008 : 06 M 6C : 1 : 06	Word	Control of the control unit:			
	bit 0	Return to factory setting	√	√	√
	bit 1	Clear all statistics (counters included)			√
	bit 2	Reset thermal memory <i>Note: If you reset the thermal memory, the motor will not be properly thermally-protected.</i>			√
	bits 3-15	(Reserved)			

 WARNING**AUTOMATIC RESTART OF THE MOTOR**

The motor will automatically restart if the control bits 704.0 and 704.1 were not previously overwritten to zero by the PLC application, in case of a cyclic writing to register 704 and on the occurrence of one of the following events:

- Loss followed by restoration of the outputs power supply 24 VDC.
- Change in position of rotary knob on power base followed by return to Ready position.
- Communication break followed by restoration.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Group 7. HMI Monitoring Variables with a TeSys U Power Base

HMI Monitoring Variables

Group 7 HMI monitoring variables are described below.

HMI monitoring registers are divided into sub-groups:

- Monitoring of control unit
- Controlling of control unit keypad

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCA	LUCB/C/D	LUCM
Monitoring of control unit - Read only

	bit 3	Enter key			√
	bits 4-15	<i>(Reserved)</i>			

Communication Variables with a TeSys U Controller Base

2

Introduction

Communication variables are listed in tables. Each one belongs to a group (such as, identification, statistics, or monitoring) and is associated to a controller base, with a control unit attached.

The associated TeSys U Controller base is LUTM**.

What's in this Chapter?

This chapter contains the following topics:

Topic	Page
Table Structure with a TeSys U Controller Base	38
Group 1. Identification Variables with a TeSys U Controller Base	40
Group 2. Statistics Variables with a TeSys U Controller Base	43
Group 3. Monitoring Variables with a TeSys U Controller Base	48
Group 4. Configuration Variables with a TeSys U Controller Base	53
Group 5. Setting Variables with a TeSys U Controller Base	56
Group 6. Control Variables with a TeSys U Controller Base	60
Group 7. HMI Monitoring Variables with a TeSys U Controller Base	62

Table Structure with a TeSys U Controller Base

Table Format (Columns 1-5)

Variables are described in 5-column tables (from left to right):

1. Protocol addresses
2. Object types
3. Description/possible values
4. Control unit: LUCBT, LUCDT
5. Control unit: LUCMT

Column 1: Protocols Addresses

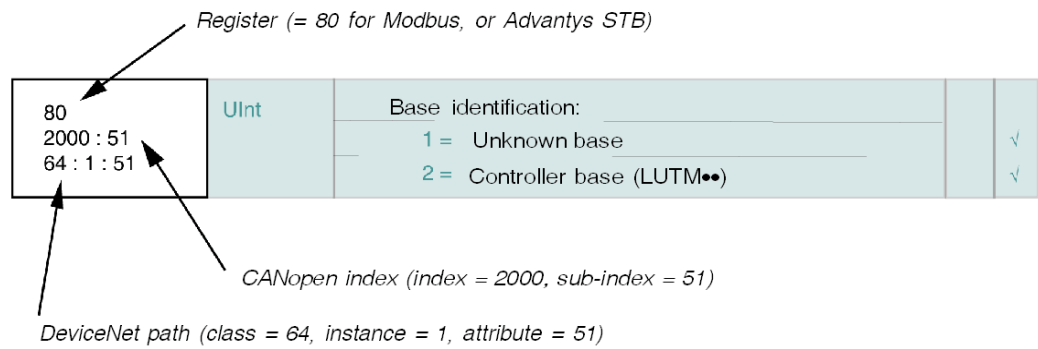

Logic addresses of protocols, for each communication variable, are:

- **Register** (format = decimal)
 - Modbus, with direct addressing.
 - Advantys STB, through PKW addressing.
- **CANopen index** (format = Index : sub-index), with direct addressing or through PKW.
- **DeviceNet path** (format = Class : instance : attribute), with direct addressing or through PKW

NOTE:

- CANopen mappable objects are identified by the character "M" beside each address.

Example with variable 80:

Column 2: Object Types

Object types can be:

- **Int**: signed integer using one register (16 bits)
- **UInt**: unsigned integer using one register (16 bits)
- **Word**: Set of 16 bits.

Example with variable 80:

Column 3: Description / Values

The short description of the register can include:

- range of values,
- default value,
- minimum / maximum values.

Example with variable 80:

80 2000 : 51 64 : 1 : 51	UInt	Base identification: 1 = Unknown base 2 = Controller base (LUTM●●)	√ √
--------------------------------	------	--	--------

Possible values = 1, 2

Variable description = Base identification

Columns 4 to 5: Control Units

The two possible Control unit types are:

- Column 4: Advanced (LUCBT●●, LUCDT●●)
- Column 5: Multifunction (LUCMT●●)

If a feature or function is supported by the control unit, there is a checkmark in the corresponding cell. If not, the cell is empty.

Example with variable 80:

80 2000 : 51 64 : 1 : 51	UInt	Base identification: 1 = Unknown base 2 = Controller base (LUTM●●)			√ √
--------------------------------	------	--	--	--	--------

This variable is only supported by a Multifunction Control Unit (LUCMT●●)

Group 1. Identification Variables with a TeSys U Controller Base

Identification Variables

Group 1 Identification variables are described below.

Identification registers are divided into sub-groups:

- Module identification
- Control unit identification
- Base identification
- Motor controller identification

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Module identification - Read only				
50 2000 : 33 64 : 1 : 33	Word	Module commercial reference: MSB ASCII char 1, LSB ASCII char 2	√	√

Group 4. Configuration Variables with a TeSys U Controller Base

Configuration Variables

Group 4 Configuration variables are described below.

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT	
General configuration - Read/Write with motor stopped, main poles open					
600 2006 : 01 6A : 1 : 01	UInt	Define an access code to lock LUCMT keypad: 0000 = keypad not protected (default) 0001-9999 = keypad protected <i>Note: Perform the action once only. Refer to LUCM/LUCMT Multifunction Control Unit User's Guide, 8_Password menu.</i>		√	
601 2006 : 02 6A : 1 : 02	Word	Configuration:			
	bit 0	Configuration menu: 0 = exit the configuration menu 1 = go to the configuration menu		√	
	bit 1	TeSys U base type: 1 = controller base		√	
	bits 2-6	<i>(Reserved)</i>		√	
	bit 7	Preserve local configuration, preventing network overwrite (LUCMT ≥ V3.x)		√	
	bits 8-12	<i>(Reserved)</i>			
	Motor type, bits 13-14 (one bit is set to 1):				
	bit 13	3-phase (default = 1)		√	
	bit 14	1-phase		√	
	bit 15	Auxiliary fan cooled (default = 0)		√	
602 2006 : 03 6A : 1 : 03	Word	Control configuration:			
	Reset mode after thermal overload fault, bits 0-2 (one bit is set to 1):				
	bit 0	Manual (default value = 1)	√	√	
	bit 1	Remote (or control unit keypad with LUCMT)	√	√	
	bit 2	Automatic	√	√	
	bit 3	Control unit communication parity: 0 = none (default) - 1 = even		√	
	bit 4	Communication control enabled/disabled: 0 = disabled - 1 = enabled (default)		√	
	LUCMT Modbus port watchdog, bits 5-8 (one bit is set to 1):				
	bit 5	Ignored (default value = 1)		√	
	bit 6	Warning		√	
bit 7	Drop-out		√		
bit 8	Trip		√		
bits 9-15	<i>(Reserved)</i>				
603 2006 : 04 6A : 1 : 04	UInt	Control unit communication on LUCMT Modbus port address min = 1 (default) - max = 247		√	
604 2006 : 05 6A : 1 : 05	UInt	Control unit communication on LUCMT Modbus port baud rate values = 1,200 - 4,800 - 9,600 - 19,200 (default)		√	
605 2006 : 06 6A : 1 : 06	UInt	Overcurrent trip threshold (%FLA) min = 300 - max = 1,700 - step = 20 default value = 1,420		√	
606 2006 : 07 6A : 1 : 07	UInt	Trip class (s) min = 5 (default) - max = 30 - step = 5		√

Group 5. Setting Variables with a TeSys U Controller Base

Setting Variables

Group 5 Setting variables are described below.

Setting registers are divided into sub-groups:

- Control unit setting
- Communication module code setting
- Communication module setting

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Control unit setting - Read / Write				
650 2007 : 01 M 6B : 1 : 01	Word	Display language: 1 = English (default) 2 = Français 3 = Español 4 = Deutsch 5 = Italiano		√
651 2007 : 02 M 6B : 1 : 02	Word	Display of running items:		
	bit 0	Display of average current (default = 1)		√
	bit 1	Display of thermal level (default = 1)		√
	bit 2	Display of L1 current		√
	bit 3	Display of L2 current		√
	bit 4	Display of L3 current		√
	bit 5	Display of ground current		√
	bit 6	Display of last trip		√
	bit 7	Display of phase imbalance (default = 1)		√
	bit 8	Display of operating time		√
bits 9-15		<i>(Reserved)</i>		
652 2007 : 03 M 6B : 1 : 03	UInt	Full load amps setting (%FLAmax) min. 33 (default) - max. 100		√

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Communication module code setting - Read / Write				
680 (Modbus only)	UInt	Communication module identification code setting: 0 = force automatic identification 1 = no communication module other = communication module identification code		√

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Communication module setting - Read / Write				
681 2007 : 20 M 6B : 1 : 20	UInt	Communication module watchdog timeout (s) min. 1 - max. 65,531 default value = 6,000	√	√
682 2007 : 21 M 6B : 1 : 21	UInt	Communication loss fallback strategy, 0-5: 0 = fallback mode disabled, communication loss not detected 1 = fallback mode frozen, no change in control state authorized when communication loss is detected, new command only taken into account after acknowledgment 2 = forced stop, outputs OA1=0 and OA3=0 (default) 3 = fallback mode unchanged, no change in control state authorized when communication loss is detected, new command can be taken into account before acknowledgment (703.3) 4 = forced operation forward, output OA1=1 (forward) and OA3=0 5 = forced operation reverse, output OA1=0 and OA3=1 (reverse)	√	√
683 2007 : 22 M 6B : 1 : 22	UInt	Local / remote control: 0 = remote mode (via the bus) 1 = local mode (default) 2 = remote/local mode managed by I.10: - remote if I.10=0 - local if I.10=1	√	√

	bits 8-15	(Reserved)		
686 2007 : 25 M 6B : 1 : 25	UInt	Outputs OA1 and OA3 configuration:		
	bits 0-7	Output OA1 assignment min. 0 - max. 45 default value = 12 <i>See Assignment of outputs LO1, OA1, OA3, 13, 23, page 59</i>	√	√
	bits 8-15	Output OA3 assignment min. 0 - max. 45 default value = 13 <i>See Assignment of outputs LO1, OA1, OA3, 13, 23, page 59</i>	√	√
687 2007 : 26 M 6B : 1 : 26	UInt	Outputs13 and 23 configuration:		
	bits 0-7	Output 13 assignment min. 0 - max. 45 default value = 12 <i>See Assignment of outputs LO1, OA1, OA3, 13, 23, page 59</i>	√	√
	bits 8-15	Output 23 assignment min. 0 - max. 45 default value = 13 <i>See Assignment of outputs LO1, OA1, OA3, 13, 23, page 59</i>	√	√

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCB/DT	LUCMT
Communication module setting - Read / Write				
688 2007 : 27 M 6B : 1 : 27	UInt	Recovery mode after a stop:		
	bit 0	In recovery mode, to avoid any unwanted motor restart after an event has generated a stop: - 24VDC cuts out then resumes (output power), - return to Ready position (457.0-17 = 1), 0 = disabled 1 = enabled	√	√
	bits 1-15	<i>(Reserved)</i>		
690 2007 : 29 M 6B : 1 : 29	UInt	Control unit identification 0 = automatic identification 1 = forced to LUCB/C/D 2 = forced to LUCMT	√	√

Assignment of outputs LO1, OA1, OA3, 13, 23

Register 685 (for output LO1), register 686 (for outputs OA1 and OA3), and register 687 (for outputs 13 and 23) assign values. An output copies the state of a register bit.

Value	Description of assigned value	LUCBT/DT	LUCMT
0	The corresponding output is forced to 0 (0V)	√	√
1	The corresponding output is forced to 1 (24V)	√	√
2	State of register 700, bits 0-4: - 700.0 --> LO1 - 700.1 --> OA1 - 700.2 --> OA3 - 700.3 --> 13 - 700.4 --> 23	√	√
3	452.3 (Thermal overload fault)	√	√
4	461.3 (Thermal overload warning)	√	√
5	457.0 (System ready)	√	√
6	457.1	√	√
7	State of bit 457.2	√	√
8	The corresponding output copies the result of "Reflex stop 1: forward"	√	√
9	The corresponding output copies the result of "Reflex stop 1: reverse"	√	√
10	The corresponding output copies the result of "Reflex stop 2: forward"	√	√
11	The corresponding output copies the result of "Reflex stop 2: reverse"	√	√
12	The corresponding output copies the result of "Forward direction" (default OA1 value)	√	√
13	The corresponding output copies the result of "Reverse direction" (default OA3 value)	√	√
14	452.0 (Short-circuit fault)	√	√
15	452.1 (Overcurrent fault)	√	√
16	452.2 (Ground fault)		√
17	452.3 (Thermal overload fault)	√	√
18	452.4 (Long start fault)		√
19	452.5 (Mechanical locking (jam) fault)		√
20	452.6 (Phase imbalance fault)		√
21	452.7 (Underload fault)		√
22	452.8 (Shunt trip)		√
23	452.9 (Test trip)		√
24	452.10 (Communication loss fault on LUCMT Modbus port)		√
25	452.11 (Control unit internal fault)	√	√
26	452.12 (Module identification or internal communication fault)		√
27	452.13 (Module internal fault)	√	√
28-31	<i>(Reserved)</i>		
32	461.2 (Ground fault warning)		√
33	461.3 (Thermal overload warning)	√	√
34	461.4 (Long start warning)		√
35	461.5 (Mechanical locking (jam) warning)		√
36	461.6 (Phase imbalance warning)		√
37	461.7 (Under-current warning)		√
38-39	<i>(Reserved)</i>		
40	461.10 (Communication loss on LUCMT Modbus port)		√
41	461.11 (Internal temperature warning)		√
42	461.12 (Module identification or internal communication warning)		√
43-44	<i>(Reserved)</i>		
45	461.15 (Module warning)	√	√

Group 6. Control Variables with a TeSys U Controller Base

Control Variables

Group 6 Control variables are described below.

Control registers are divided into sub-groups:

- Control of the communication module
- Control of the system and control unit

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Control of the communication module - Read / Write				
700 2008 : 01 6C : 1 : 01	Word	Output control:		
	bit 0	Control of output LO1 (if 685=2)	√	√
	bit 1	Control of output OA1 (if 686 LSB=2)	√	√
	bit 2	Control of output OA3 (if 686 MSB=2)	√	√
	bit 3	Control of output 13 (if 687LSB=2)	√	√
	bits 5-15	<i>(Reserved)</i>		
703 2008 : 04 6C : 1 : 04	Word	Control of communication module:		
	bits 0-2	<i>(Reserved)</i>		
	bit 3	Reset warning (for example, communication loss)	√	√
	bits 4-15	<i>(Reserved)</i>		

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Control of the system and control unit (704-705) - Read / Write				
704 2008 : 05 6C : 1 : 05	Word	Control of the system:		
	bit 0	Run forward	√	√
	bit 1	Run reverse	√	√
	bit 2	<i>(Reserved)</i>		
	bit 3	Fault reset: if register 451=102 or 104, fault acknowledgment causes a return to communication module factory settings	√	√
	bit 4	<i>(Reserved)</i>		
	bit 5	Launch automatic thermal overload fault test: This test simulates a thermal overload. Bit 9 of Fault register 452 is set to 1 indicating "Test trip fault" and bit 3 of Warning register 461 is set to 1 indicating "Thermal warning".		√
	bits 6-11	<i>(Reserved)</i>		
	bit 12	Launch trip test via communication bus: This test simulates a short circuit. Bit 8 of Fault register 452 is set to 1 indicating "Shunt trip fault".		√
bit 13-15	<i>(Reserved)</i>		√	
705 2008 : 06 6C : 1 : 06	Word	Control of the control unit:		
	bit 0	Return to factory setting	√	√
	bit 1	Clear all statistics (counters included)		√
	bit 2	Reset thermal memory <i>Note: If you reset the thermal memory, the motor will not be properly thermally-protected.</i>		√
	bits 3-15	<i>(Reserved)</i>		

 WARNING**AUTOMATIC RESTART OF THE MOTOR**

The motor will automatically restart if the control bits 704.0 and 704.1 were not previously overwritten to zero by the PLC application, in case of a cyclic writing to register 704 and on the occurrence of one of the following events:

- Loss followed by restoration of the outputs power supply 24 VDC.
- Change in position of rotary knob on power base followed by return to Ready position.
- Communication break followed by restoration.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Group 7. HMI Monitoring Variables with a TeSys U Controller Base

HMI Monitoring Variables

Group 7 HMI monitoring variables are described below.

HMI monitoring registers are divided into sub-groups:

- Monitoring of control unit
- Controlling of control unit keypad

Registers

Register CANopen index DeviceNet path	Object type	Description / Possible values	LUCBT/DT	LUCMT
Monitoring of control unit - Read only				
1000 200B : 01 M 6F : 1 : 01	Word	Monitoring the keypad:		
	bit 0	Escape key		√
	bit 1	Up key		√
	bit 2	Down key		√
	bit 3	Enter key		√
	bits 4-15	(Reserved)		
1001 200B : 02 M 6F : 1 : 02	Word	Display content: MSB ASCII = char1 - LSB ASCII = char2		√
1002 200B : 03 M 6F : 1 : 03	Word	Display content: MSB ASCII = char3 - LSB ASCII = char4		√
