Water quality – Selection and application of ready-to-use test kit methods in water analysis

BS ISO 17381:2003

The aim of this International Standard is to set up criteria as to when the different kinds of ready-to-use methods may be applied for the analysis of distinct parameters in water samples (e.g. potable water, river water, process water, waste water) and which steps are necessary to prove their suitability for a certain application.

Ready-to-use methods have to meet special requirements because they are often used by non-chemists. This International Standard lists requirements for the producers of these tests, concerning safety and environmental aspects as well as handling and a description of the procedure.

The first part of the above is a requirement on the user.

The second part is a requirement on the manufacturer, Palintest Ltd.

Palintest Ltd can state that the test kits and reagents provided to FLUIDRA ESPAÑA, S.A.U conform to the general principles underlying this ISO standard.

Kind regards,

Bryony Vaughan
European Sales Executive
