

Motor Brackets

The motor bracket is placed on the head of the motor and maintains the motor head to the side of the rolling shutter box or the awning.

It supports the torque of the motor and half of the weight of the end-product.

Some of our motors brackets can be directly adapted, others need an additional part (corner plate) to fit onto the end-product.

The LS 40 motors brackets have a different shape than the diameter 50 or 60 that have the 'star head' (except the RH motor ranges).
