Client	Sex	Ethnicity	Birth Date	Height	Weight	Measured
--------	-----	-----------	------------	--------	--------	----------

Abdomen Composition

Adipose Tissue
1 Visceral
2 Subcutaneous

The Android region is that of the abdomen, and often the body type with increased fat in this area is described as "apple shaped." The Gynoid region is that around the hips and thighs and often the body type with increased fat in this area is described as "pear shaped." Understanding where fat is stored on the body is recognized as an important predictor of the potential health risks of obesity.

CoreScan estimates the VAT (Visceral Adipose Tissue) content within the android region, VAT is a specific type of fat that is associated with several types of metabolic diseases such as obesity, metabolic syndrome, and type 2 diabetes. CoreScan results have been validated for adults between ages 18-90, and with a BMI in the range of 18.5-40.

Body Composition

Body composition is used to describe the percentages of fat, lean, and bone in human bodies.

Because muscular tissue takes up less space in our body than fat tissue, our body composition, as well as our weight, determines leanness.

Image color-coding shown here helps to visualize the different components of your body composition.

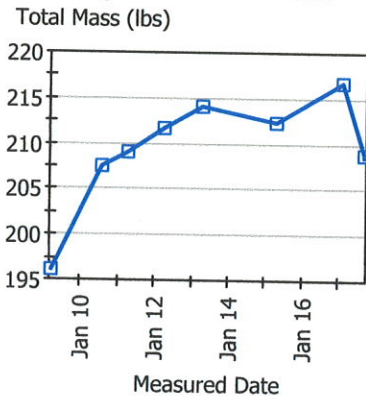

The table and charts below represent your historical composition results.

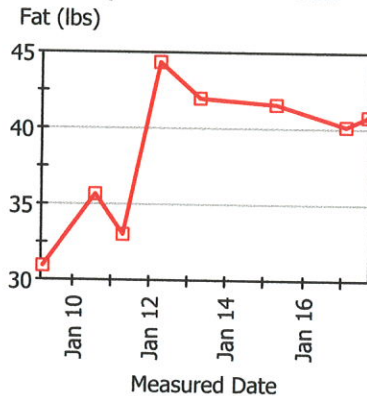

Measured Date:	03/18/2009	04/18/2015 (e)	02/13/2017 (e)	09/14/2017 (e)
Total Mass (lbs):	196.0	212.3	216.8	208.8
Fat Mass (lbs):	30.9	41.6	40.1	40.8
Lean Mass (lbs):	156.7	162.3	168.3	159.6
%Fat:	16.5	20.4	19.2	20.4
Total Mass Baseline %Change:	baseline	8.3%	10.6%	6.5%
A/G Ratio:	1.06	1.24	1.42	1.34

A/G Ratio: The Android region is that of the abdomen, and often the body type with increased fat in this area is described as "apple shaped." The Gynoid region is that around the hips and thighs and often the body type with increased fat in this area is described as "pear shaped." Understanding where fat is stored on the body is recognized as an important predictor of the potential health risks of obesity.

Resting Metabolic Rate (RMR)

Resting Metabolic Rate (RMR) is synonymous with Resting Energy Expenditure (REE) and is an estimate of how many calories you would burn if you were to do nothing but rest. It represents the minimum amount of energy needed to maintain body temperature, heartbeat, and respiratory rate.

RMR: 1,914 cal/day

*RMR (Resting Metabolic Rate) based on Mifflin-St Jeor equation.
 $RMR = 19.7 \times FFM(\text{fat free mass}) + 413$
 Mifflin MD, St Jeor ST, Hill LA, Scott BJ, Daugherty SA, Koh YO. A new predictive equation for resting energy expenditure in healthy individuals., *Am J Clin Nutr.* 1990 Feb;51(2):241-7. PMID: 2305711*

Body Mass Index (BMI)

Your Body Mass Index (BMI) is an estimate of your body fat, based on your height and weight. While it is generally accurate, the BMI can read too high for athletes or others with large, heavy muscles. Likewise, it can exaggerate low readings for frail older people who have lost muscle mass.

Measured Date	BMI (kg/m ²)
03/18/2009	27.2
08/05/2010	27.2
04/20/2011	28.6
03/30/2012	28.6
04/19/2013	29.3
04/18/2015	29.3
02/13/2017	29.3
09/14/2017	29.3
