

DRIVE CAPACITOR REFORMING SERVICES

Intertape Polymer Group®

SUCCESSFUL STARTUPS AND PEACE OF MIND

Intertape Polymer Group Inc. (IPG) manufactures a broad range of packaging products and systems that reflect the needs of industrial and retail customers, including tapes, films, protective packaging, woven and non-woven products, and machinery. After purchasing 14 drives, IPG sought to reform the capacitors before installation to limit the potential for failure upon startup, the result of which would be sourcing spares amid supply chain constraints.

Solutions

Werner Electric Supply's Drives and Motor Control Centers (MCC) team created a package to perform a capacitor reform on all the drives, including a detailed report for IPG to review:

- Travel to customer location to complete the service
- Perform a basic inspection to identify visible problems with the drives
- Run diagnostics and provide insights into drive condition
- Reform capacitor to prevent drive failures
- Drive burn-in

Partnership

Thanks to the on-site drive capacitor reforming service, IPG avoided using internal labor and resources to pull drives out of MCC buckets, prepare them for shipment and then reinstall them once the work was complete. The service has given IPG confidence that its drives will start successfully and bring value to their operation through reliable, efficient operation.

PROJECT FEEDBACK

"The largest value for me is an added peace of mind that the drives will power up and run without failure. The fact that Werner Electric was willing to come to our facility to do this work shows that they are committed to the customer and will do what it takes to find a solution."

Kurt Hintz

IPG Electrical Engineer
