

# DRIVE CAPACITOR REFORMING SERVICES

## Modular Web Solutions

### AN INSURANCE POLICY FOR SUCCESS

Modular Web Solutions, based in Greenville, Wisconsin, has over 45 years of experience designing and building custom equipment used for web handling. When a machine test required Modular Web Solutions to utilize a shop drive that had not been energized in several years, the company sought options to avoid potential capacitor failure and the resulting strains of downtime and ordering a new drive amid availability issues.

### Solutions

Werner Electric Supply's Drives and Motor Control Centers team performed a drive capacitor reforming service to ensure the drive had the best chance of functioning properly:

- Pick up the drive that requires attention
- Perform a basic inspection to identify visible problems with the drive
- Run diagnostics and provide insights into drive condition
- Reform capacitor to prevent drive failure
- Drive burn-in

### Partnership

After a successful capacitor reform with Werner Electric, Modular Web Solutions turned to our team for an additional reform, this time for a drive that had been stored in suboptimal conditions. The capacitor reforming service has been the affordable, efficient insurance policy for the company's drives and future success.

### PROJECT FEEDBACK

"We all buy insurance hoping we don't use it. Same thing here. From that standpoint, the price is more than fair given the effort that goes into performing the service. I would certainly be inclined to do this with other drives we have here in the future."
