HEATING

HIGH TEMPERATURE

THERMAL

WATER IS IN THE BLADDER

NO CONTACT BETWEEN STEEL SHELL AND WATER

NO RUST OR CORROSION OF THE STEEL SHELL

FEATURES AND BENEFITS

Strong welded construction

Welded steel construction is designed to withstand high pressure loads and adds safety to your installation. Tanks are sturdy and built to last while at the same time they are lightweight, easy to handle and simple to install.

Resistant electrostatic paint finish

Provides an attractive look in addition to being durable as the finish is obtained through an electrostatic paint process.

Full acceptance bladder

Withstands high temperatures. Of heavy duty construction, manufactured in house through an injection molding process. Compatible with water/glycol mixtures (up to 50%), solar and cooling systems.

Factory precharge on all models

Suits most common installations. The precharge must be manually adjusted on site.

HEATING TANKS

The HGT-HGTV Series bladder expansion tanks are available in sizes from 2 to 80 gallons in either in-line or stand models. The two shell welded construction allows the tank to withstand high pressure and therefore adds safety to your installation. The EPDM bladder separates air from water and prevents waterlogging while saving space and energy. These devices are indicated for use in hot water, solar and cooling systems, in addition to being compatible with glycol.

SERVICE VALVE #HGSV12

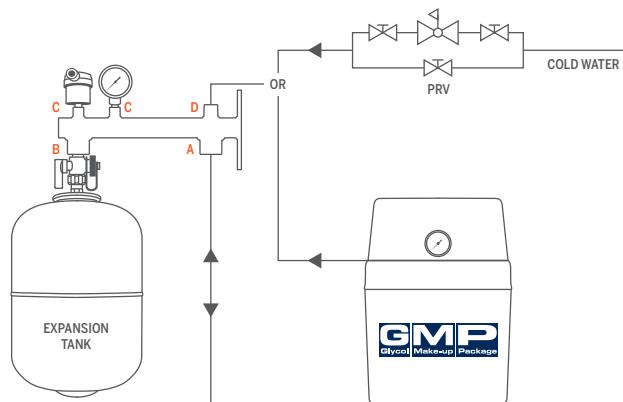

This service valve links the expansion tank to the system or to the Service Center (#HGSC-MULTI) and allows you to isolate the expansion tank from the system pressure. While the tank is shut off from the system pressure, you can inspect it (verify pressure) or remove it for replacement without having to drain the system. Once this operation is over, re-open the valve and the system will get back to normal operation. It's available in 1/2" MNPT x 1/2" FNPT and suits HGT-15, HGT-30, HGT-60M and HGT-60.

SERVICE CENTER #HGSC-MULTI

THE SERVICE CENTER FOR RESIDENTIAL HEATING SYSTEM OFFERS YOU A CLEAN AND FUSS-FREE INSTALLATION.

Link your heating system to the 1/2" FNPT connection **A**. Connect directly a heating expansion tank (HGT-15, HGT-30, HGT-60M and HGT-60), with the Service valve (HGSV12) on the 1/2" FNPT connection **B**. Then, on connections **C** (1/8" FNPT), connect an automatic air vent (R8818) or a pressure gage (#GAGEO-100BOTTOM or #GAGEO-30BOTTOM). On connection **D** (1/2" MNPT) you can either connect your GMP or simply the cold water supply.

ONCE THE SERVICE CENTER IS INSTALLED, YOU HAVE A COMPLETE OVERVIEW OF THE SYSTEM. THIS MAKES MAINTENANCE A LOT MORE EASIER!

THERMAL TANKS

FOR USE IN POTABLE WATER SYSTEMS

The HGTE-HGTEV and FTTE Series bladder expansion tanks are designed for use in domestic installations for potable hot water applications. The tanks are installed in systems equipped with a backflow preventor or as an add-on to direct or indirect water heaters. The tank's function is to absorb the increased volume of water which results from the heating process, thereby keeping the system's pressure below the relief valve setting.

HIGH TEMPERATURE TANKS PATENT PENDING

Calefactio's expansion tank series for high temperature such as systems can withstand constant temperatures of up to 315°F/157°C. These tanks have a unique design and are only available at Calefactio. Each tank has an EPDM bladder and a buffer zone. The tanks are compatible with glycol solutions (up to 50%) and will absorb expanded liquid heated by the system, thus ensuring its safety.

ALSO AVAILABLE! A WIDE VARIETY OF ASME EXPANSION TANKS. VISIT CALEFACTIO.COM FOR DETAILS.

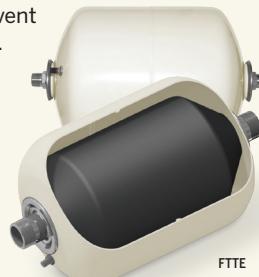

FLOW-THROUGH – FTTE NEW!

Calefactio's new flow-through potable water thermal expansion tank. It avoids stagnant water in the tank and is an easy way to prevent microbial growth associated with legionella.

- Prevents microbial growth
- Avoid stagnant water
- Integral forced circulation

*Sizing based on: 40°F incoming water temperature; 150 psi T&P safety release valve; pre-charge equal to static supply valve.

These devices should be installed by qualified and accredited professionals in accordance with the plumbing code and current local regulations. By design, these tanks are meant for heating systems, or hot water distribution systems and can be used at a maximum working pressure of 90 to 150 PSIG (depending on the model). Please note that the maximum pressure allowed in Canada is 30 PSIG and that the maximum service temperature is set at 200°F for thermal tanks, 240°F for heating tanks and 315°F for high temperature. Any use different than foreseen or any important or sudden pressure change over indicated limits above is DANGEROUS and can result in material damages, serious injuries and can even cause death.

Information in this document is founded on the most recent data available at the moment of its publication and is meant for a general presentation of our products.
