Each HR Sheave includes an **HRBK** bolt kit to use in place of standard H bushing bolts.

BK Sheaves are accurately machined from gray cast iron, statically balanced, painted and individually packaged.

Note: Cast iron sheaves may not exceed 6500 FPM. This speed **DOES NOT** specify if dynamic balancing (2 plane) is required. Contact customer service to verify whether dynamic balancing is required.

All HR sheaves use standard MasterDrive H bushings.

Installation and Operation Instructions

VL-VP FHP Adjustable Sheaves

- Loosen all setscrews on the sheave. Rotate the adjustable flange(s) to make the face width of the adjustable sheave the same as the face width of the companion sheave.
- Inspect the motor shaft and key for any nicks or burrs and remove if present. Install shaft key. Slide the sheave onto the motor shaft.
- Align the adjustable sheave with the companion sheave by using a straight edge or piece of string. This is most easily accomplished by using the four-point method shown below. Note: Dimensions, A, B, C and D must be equal for correct alignment.

- Secure the sheave to motor shaft by tightening the setscrew over the key to the proper torque (110-130 in. lbs. torque for 5/16" setscrews and 50-70 in. lbs. torque for 1/4"). Note: On two groove sheaves the setscrew is located at the base of the center flange. You may need to adjust the flange open to expose it.
- Adjust the sheave to the desired pitch diameter. Each turn of the flange changes the pitch diameter approximately .16 inches. Six turns are required to adjust the sheave from minimum to maximum for B (5L) belts, six turns for A (4L) belts, five turns for (3L) belts; and seven turns for (5V) belts. Note: You must adjust both flanges of a two-groove sheave equally so belts will ride evenly.
- Lock the adjustable flange(s) into position by tightening the setscrew(s) to the proper torque (5/16" setscrew – 110-130 in. lbs. torque, 1/4" setscrews – 60-70 in. lbs. torque). Warning: To prevent damage to hub threads, the set screw(s) must be over the flats or in the machined groove. If the flange is not properly locked, the sheave will fail prematurely.
- Install and properly tension belts.

WARNING

Rotating equipment can cause personal injury. BE SAFE install a guard around the drive to keep anything from coming into contact with moving parts.

- Start the drive. If a speed correction is necessary, stop the drive and remove the guard and belts. Adjust the sheave as per steps 5 through 7.

* Shallow Keyseat - (Ductile Iron) Keystock supplied with bushing

† Oversize Key

Note: A rectangular key is supplied with bushings that have shallow keyseats.

This key will fit the standard depth keyseat on the shaft and the shallow keyseat on the bushing.

Ordering Example: (F1) or (F1.1/8) or (N5.7/8)

QD bushing sizes JA through N can be assembled in either of the two positions shown below. Sizes P through S should be assembled in position one. *Position One* is the conventional or standard mounting. *Position Two* (Reverse Mounting) may be necessary in some cases, such as mounting small sheaves with blind holes (not drilled through).

Position 1

Position 2

Bushing Size	Cap Screw Size-Thread	Foot Pounds Wrench Torque*
JA	10-24	3
SH-SDS-SD	1/4-20	6
SK	5/16-18	10
SF	3/8-16	20
E	1/2-13	40
F	9/16-12	50
J	5/8-11	90
M	3/4-10	150
N	7/8-9	200
P	1-8	300
W	1-1/8-7	400
S	1-1/4-7	500

*For Normal Applications. For Severe (Rock-crusher type) applications these values can be increased by a maximum of 50%

Caution: Excessive cap-screw torque can cause sheave and/or bushing breakage. The use of lubricants can cause sheave breakage.

Therefore,

DO NOT USE LUBRICANTS IN THIS INSTALLATION!

INSTALLATION:

1. Make sure the tapered-cone surface of the bushing and the mating bore of the sheave are free of all foreign substances, such as dirt, excess paint accumulations, metal chips, lubricants, etc.
2. For position one or two (whichever applies), line up the unthreaded holes (C) with the threaded holes (t) and insert cap screws with lock washers engaging only two or three threads. (*a)
3. With key in shaft keyway, slide the loosely-assembled unit onto shaft and position for good belt alignment. (*b, *c) **Use no lubricants or anti-seize compound on threads or tapered surfaces.**
4. Carefully tighten the capscrews alternately and progressively until the tapers are seated (at approximately half the recommended torque).
5. Check alignment and sheave runout (wobble) and correct as necessary.
6. Continue careful alternate and progressive tightening of the cap screws to the recommended torque values shown in the table. **Maximum torque should be achieved on each individual bolt only two times in the consecutive tightening.**

Note: When properly mounted, there will be a gap between the bushing flange and sheave after the screws are tightened.

Caution: Use of Lubricants and or excessive screw torque can cause breakage

7. Tighten the set screw, when available, to hold the key securely during installation and until cap screws are securely tightened.

REMOVAL

1. Loosen and remove all mounting cap screws.
2. Insert cap screws in all threaded jack screw holes (J).
3. Start with the screws furthest from the bushing saw slot and tighten all jack screws alternately and progressively. Keep turning the screws in small equal amounts until the tapered surfaces disengage.

(*a) When mounting a sheave on M through W size bushing, position the threaded jack-apart hole (J) as far from the bushing saw as possible to reduce the possibility of bushing breakage.

(*b) When installing large or heavy parts in *Position One*, it may be easier to mount the key and bushing on the shaft first. Then place the sheave on the bushing and align the holes.

(*c) **Caution:** When mounting on a vertical shaft, provisions must be made, which will positively prevent the sheave and/or bushing from dropping during installation.

TB BUSHINGS INSTALLATION

INSTALLATION

1. Properly clean shaft, bore and taper surface of bushing. Remove or degrease any oil, paint or dirt.
2. Install the bushing into the pulley hub. Be sure to match the hole pattern, not the threaded holes. Match the half threaded holes with the half straight holes (a complete hole will be threaded on one side only.)
3. Lightly oil the set screws(1008 to 3030) or the cap screws (3525 to 5050) , be sure to oil under the cap screw head. Install the screws into the holes that are threaded on the hub side (shown as  in diagram). DO NOT LUBRICATE THE BUSHING TAPER OR BORE. BREAKAGE OF PRODUCT MAY OCCUR.
4. Fit the pulley with the bushing onto the shaft and locate in the proper location. Install key into the keyway of the shaft and bushing.
5. Tighten screws alternately and gradually in accordance with the torques listed on the Recommended Wrench Torque chart.
6. Using a hammer with a block or sleeve (do not hit bushing directly with hammer) tap on large end of the bushing and re-tighten screws per the appropriate Wrench Torque Values.
7. Fill screw heads with grease to eliminate dirt build up.

REMOVAL

1. Remove all screws and lightly oil the point and threads. Oil under cap screws if used.
2. Install screws into the holes that are threaded only on the bushing side (shown as  in diagram).
3. Tighten screws uniformly and alternately until the bushing is loose from in the hub and pulley is free from the shaft. Tap on small end of bushing to assist removal if it does not loosen. Note: One screw is not used for removal.

DOUBLE SPLIT TAPER BUSHINGS

DOUBLE SPLIT TAPER BUSHINGS INSTALLATION INSTRUCTIONS

INSTALLATION

1. Properly clean shaft, bore and taper surfaces of bushing. Remove and degrease any excess oil, paint or dirt, this includes the cap screws. Caution: Excessive cap screw torque can cause sheave or bushing breakage. The use of lubricants can cause sheave breakage. **DO NOT USE LUBRICANTS OF ANY TYPE WITH THIS INSTALLATION.**
2. Install the bushing into the hub and match the unthreaded bushing holes with the threaded holes of the hub. Install the cap screws and lock washers through the unthreaded holes and into the threaded holes of the hub. Engage only a few threads by hand – Do not use a wrench.
3. Install key into the keyway of the shaft and fit assembly onto the shaft and locate in the proper location.
4. Tighten cap screws alternately and gradually. Tighten cap screws to the recommended Wrench Torque Value using a torque wrench.

REMOVAL

Remove cap screws and insert into the tapped holes in the bushing. Tighten them alternately and gradually until the bushing disengages from the hub.

JAW COUPLING SELECTION

Example: A 10 HP hydraulic motor running a centrifugal pump 16 hours a day. Motor shaft is 1-3/8" and pump shaft is 1-1/2"

Step #1: Determine the prime mover class. (See the Prime Mover Classifications chart)	Hydraulic Motors fall under class A
Step #2: Determine the load characteristics and the service factor. (See the Load Characteristics and Service Factors chart)	Centrifugal Pumps are uniformly loaded. The prime mover class of the motor is A and the motor is running over 8 hours per day. The service factor would be 1.5.
Step #3: Calculate Design Horsepower or Design Torque. • If Prime Mover is a 1200, 1800, or 3600 RPM motor: Design HP = Prime Mover HP x Service Factor. (See the Torque-Horsepower Ratings charts & reference the corresponding motor RPM column) • If Prime Mover is not one of the speeds above: Design HP @ 100 RPM = (Prime Mover HP x Service Factor x 100) / Coupling RPM. (See chart on pages 2-3 and reference HP @ 100 RPM column) • If using Prime Mover Torque: Design HP = Prime Mover Torque x Service Factor. (See chart on page 2 and reference Torque column)	Prime Mover is an 1800 RPM motor. Design HP = 10 x 1.5 = 15. Looking at the Torque-Horsepower Ratings charts the options are: L110 with Buna insert, L095 with Hytrel insert or L110 with urethane insert.
Step #4: Check the Torque-Horsepower Ratings charts for max. bore of coupling.	1-1/2" shaft on the pump is too large for L095 or L100 couplings. Use L110 with Buna insert. For complete coupling order: 1 - L110-1.3/8 1 - L110-1.1/2 & 1- L110N

Installation

1. Clean sheaves/pulleys, and remove dust, dirt and oil.
2. Check for worn grooves using sheave gauge.
3. Use correct belt for sheave size
4. Never "roll" or "pry" the belts into the sheave grooves.
Move the driver unit to allow belt to slip on easily.
5. Check alignment. Drive shafts must be parallel.
6. Rotate each sheave to check for wobble or bent drive shaft.
7. Tighten the belt take-up and then run the belt 10 minutes.
Recheck and adjust tension, using tables on reverse.

Warning

When servicing a drive, be certain machinery is SHUT OFF and properly prevented from accidentally starting. Do not wear loose clothing, jewelry, etc. Keep guards on machinery when it is operating.

Rapid Belt Failure

SYMPTOM	CORRECTION
Belt cover wears rapidly	Replace sheaves
Slip burns-shiny sheave grooves	Increase tension
Belt hard and cracked	Heat condition; Ventilate drive; Check tension
Belt sticky or soft	Eliminate oil

Belt Tensioning

STEP 1: After measuring the belt span (see sketch) use a belt tension tester and apply perpendicular force to any ONE of the belts at the span mid-point. Measure the force required to deflect any of the belts 1/64 inch for every inch of span length. EXAMPLE: A 32" span deflection would be 1/64 inch x 32 or 1/2 inch.

Note: When new belts are installed on a drive, the tension will drop rapidly during the first few hours. Thus, for new belts, multiply the maximum deflection force shown in the tensioning tables by 1.33. Check tension frequently during the first 24 hours of operation. Subsequent retensioning should fall between the minimum and maximum forces shown in the tables. STEP 2: Compare Step 1 deflection force reading with range of force in the following tensioning tables. If the force is below the minimum after any adjustment per above note, then the belts are too loose.

If the force is greater than the maximum after any adjustment per above note, then the belts are too tight.

Readjust measured drive tension until the deflection force is between the maximum and minimum values shown in or calculated from the respective tensioning tables.

The deflection forces in these tables apply only to the listed belts currently being manufactured.

How to Diagnose V-Belt Failure

Snub Break

Cause

Cover wear indicates slip. Clean break reveals sudden snap.

Prevention

Maintain proper tension on the drive.

Distorted Belt

Cause

Breakdown of adhesion or broken cords.

Prevention

Do not pry belts on drives. Check sheaves for recommended diameters.

Abrasion

Cause

Foreign material and rust in sheaves wore away sidewalls, letting belt drop to bottom of groove.

Prevention

Dust guards help protect against abrasion. Tension must be maintained in dusty atmospheres.

Oil Deterioration

Cause

Oil-softened rubber.

Prevention

Splash guards will protect drives against oil. Although Classical belts are oil resisting, excessive oil can cause some deterioration.

Cover Fabric Rupture

Cause

Cover fabric ruptured when belt was pried over sheave during installation.

Prevention

Proper installation of belts by moving motor so belts do not have to be pried into the grooves.

Slip Burn

Cause

Belt too loose. Belt didn't move, friction against sheave burned rubber. When belt finally grabbed, it snapped.

Prevention

Maintain proper tension on the drive.

Base Cracking

Cause

Sever back-bend idlers. Improper storage. Excessive ambient operating temperature.

Prevention

Check storage conditions. If back-bend idler cannot be avoided, install idler for larger diameter. Avoid ambient temperature over 140°.

Ply Separation

Cause

Split along pitch line indicating belt ran over too small a sheave.

Prevention

Redesign drive using sheaves of proper size.

Ruptured

Cause

Ruptured cords in the plies.

Prevention

Check for rocks or tools falling into sheave grooves. Check tension. Belts loose enough to twist in groove can rupture cords.

Worn Belt Sides

Cause

Misalignment. Grit or dirt. Normal wear.

Prevention

Align sheaves. Replace belts as required.

V-Belt	Belt Section	Minimum Sheave Pitch Diameter
Classical	A	3"
	B	5.4"
	C	9"

Safety should be your number one concern.

* Always turn equipment OFF before installing a belt.

* Every v-belt should have a proper belt guard.

* Before installation, check safe speed limits for sheaves.

* Before installation, lock out the disconnect switch, control valve or the like.

* Wear gloves when inspecting sheaves to prevent injury from burrs.

All sheaves are statically balanced (sheave is put on a shaft to determine imbalance position & weight then the relevant weight is drilled off.) Dynamic balancing is necessary on certain applications (sheave & bushing are installed on a motor running at the desired RPM requirement and then balanced accordingly. Contact customer service to verify whether dynamic balancing is required.

Bearing Load Calculations

To find actual loads, it is necessary to know machine component weights and values of all other forces contributing to the load. Sometimes it becomes desirable to know the bearing load imposed by the V-belt drive alone. This can be done if you know bearing spacing with respect to the sheave center and shaft load and apply it to the formula:

Overhung Sheave

$$\text{Load at B, lbs} = \frac{\text{Shaft Load} \times (a+b)}{a}$$

$$\text{Load at A, lbs} = \frac{\text{Shaft load} \times b}{a}$$

Where: a and b = spacing, inches

*d = Diameter of engine sheave

SPM = Strokes Per Minute

RPM = Engine Speed in Revolutions Per Minute

R = Gear box ratio

*C = Shaft center distance

**Required values to determine belt length*

$$\text{Belt length} = 2C + 1.57 (D+d) + \frac{(D-d)^2}{4C}$$

$$D = \frac{\text{RPM} \times d}{\text{SPM} \times R}$$

$$\text{RPM} = \frac{\text{SPM} \times R \times D}{d}$$

$$d = \frac{\text{SPM} \times R \times D}{\text{RPM}}$$

$$R = \frac{\text{RPM} \times d}{\text{SPM} \times D}$$

$$\text{SPM} = \frac{\text{RPM} \times d}{R \times D}$$

Sheave Between Bearings

$$\text{Load at D, lbs} = \frac{\text{Shaft Load} \times c}{c + d}$$

$$\text{Load at C, lbs} = \frac{\text{Shaft Load} \times d}{c + d}$$

ENGINEERING INFORMATION—Torque and Horsepower Equivalents

A foot-pound is the amount of energy expended in lifting a one-pound mass a distance of one foot against the pull of gravity.

FOOT-POUNDS INDICATE ENERGY

$$\begin{aligned}\text{Torque (in Pound-Inches)} &= \frac{63,025 \times \text{HP}}{\text{RPM}} \\ &= \text{Force} \times \text{Lever Arm (in Inches)} \\ \text{Torque (in Pound-Feet)} &= \frac{5,252 \times \text{HP}}{\text{RPM}} \\ &= \text{Force} \times \text{Lever Arm (in Feet)}\end{aligned}$$

Force = Working Load in Pounds.

FPM = Feet Per Minute.

RPM = Revolutions Per Minute.

Lever Arm = Distance from the Force to the center of rotation in Inches or Feet.

How to Read Torque Tables

The tables on the following pages give the Torque in Pound-Inches for ranges of HP and RPM values.

For fractional HP values move the decimal points to the left in HP and Torque values.

HORSEPOWER

Common Unit of Mechanical power. (HP) One HP is the rate of work required to raise 33,000 pounds one foot in one minute.

An overhung load is a bending force imposed on a shaft due to the torque transmitted by V-drives, chain drives and other power transmission devices, other than flexible couplings.

Most motor and reducer manufacturers list the maximum values allowable for overhung loads. It is desirable that these figures be compared with the load actually imposed by the connected drive.

Overhung loads may be calculated as follows:

$$\text{O.H.L.} = \frac{63,000 \times \text{hp} \times F}{N \times R}$$

Where HP = Transmitted hp $\times$ service factor.

N = RPM of shaft.

R = Radius of sprocket, pulley, etc.

F = Factor.

To find circumference of a circle, multiply diameter by 3.1416.

To find diameter of a circle multiply circumference by .31831.

To find area of a circle, multiply square of diameter by .7854.

To find area of a rectangle, multiply length by breadth.

To find area of a triangle, multiply base by $\frac{1}{2}$ perpendicular height.

To find area of ellipse, multiply product of both diameters by .7854.

To find area of parallelogram, multiply base by altitude.

To find side of an inscribed square, multiply diameter by 0.7071 or multiply circumference by 0.2251 or divide circumference by 4.4428.

To find side of inscribed cube, multiply radius of sphere by 1.1547.

To find side of an equal square, multiply diameter by .8862.

To find the surface of a sphere, square the diameter and multiply by 3.1416.

To find the volume of a sphere, cube the diameter and multiply by .5236.

A pound-foot is the moment created by a force of one pound applied to the end of a lever arm one foot long.

POUND-FEET INDICATE TORQUE

Example:

$$25 \text{ HP at } 150 \text{ RPM} = 10504 \text{ Pound-Inches Torque}$$

$$2.5 \text{ HP at } 150 \text{ RPM} = 1050.4 \text{ Pound-Inches Torque}$$

For other values of RPM move decimal point in RPM values to the left or right as desired, and in Torque values move to the right or left (opposite way) the same number of places.

Example:

$$25 \text{ HP at } 150 \text{ RPM} = 10504 \text{ Pound-Inches Torque}$$

$$25 \text{ HP at } 1.50 \text{ RPM} = 1050400 \text{ Pound-Inches Torque}$$

$$2.5 \text{ HP at } 1.50 \text{ RPM} = 105040 \text{ Pound-Inches Torque}$$

$$\text{HP} = \frac{\text{Force} \times \text{FPM}}{33,000}$$

$$\text{HP} = \frac{\text{Torque (in Pound-Inches)} \times \text{RPM}}{63,025}$$

$$\text{HP} = \frac{\text{Torque (in Pound-Feet)} \times \text{RPM}}{5,252}$$

Overhung Loads

Weights of the drive components are usually negligible. The formula is based on the assumption that the load is applied at a point equal to one shaft diameter from the bearing face. Factor F depends on the type of drive used:

$$F = \begin{cases} 1.00 & \text{for single chain drives.} \\ 1.10 & \text{for TIMING belt drives.} \\ 1.25 & \text{for spur or helical gear or double-chain drives.} \\ 1.50 & \text{for V-belt drives.} \\ 2.50 & \text{for flat belt drives.} \end{cases}$$

Example: Find the overhung load imposed on a reducer by a double chain drive transmitting 7 hp @ 30 RPM. The pitch diameter of the sprocket is 10"; service factor is 1.3.

Solution:

$$\text{O.H.L.} = \frac{(63,000)(7 \times 1.3)(1.25)}{(30)(5)} = 4,780 \text{ lbs.}$$

Mathematical Equations

A side of a square multiplied by 1.4142 equals diameter of its circumscribing circle.

A side of a square multiplied by 4.443 equals circumference of its circumscribing circle.

A side of a square multiplied by 1.128 equals diameter of an equal circle.

A side of a square multiplied by 3.547 equals circumference of equal circle.

To find gallon capacity of tanks (given dimensions of a cylinder in inches), square the diameter of the cylinder, multiply by the length and by .0034.

METRIC SYSTEM OF MEASUREMENTS

The principle units are the meter for length, the liter for capacity, and the gram for weight.
The following prefixes are used for sub-divisions and multiples: milli = 1/1000; centi = 1/100; deci = 1/10; deca = 10; hecto = 100; kilo = 1000.

Measure of Length

10 millimeters(mm) = 1 centimeter
10 centimeters = 1 decimeter(dm)
10 decimeters = 1 meter(m)
100 meters = 1 kilometer(km)

Measures of Weight

10 milligrams(mg) = 1 centigram(cg)
10 centigrams = 1 decigram(dg)
10 decigrams = 1 gram(g)
10 grams = 1 decagram(Dg)
10 decagrams = 1 hectogram(Hg)
10 hectograms = 1 kilogram(Kg)
1000 kilograms = 1 (metric) ton (T)

Square Measure

100 sq. millimeters(mm²) = 1 centigram
10 sq. centimeters = 1 sq. decimeter(dm²)
100 sq. decimeters = 1 sq. meter(m²)

Dry and Liquid Measure

10 millimeters(ml) = 1 centiliter(cl)
10 centiliters = 1 deciliter(dl)
100 liters = 1 hectoliter(Hl)
1 liter = 1 cu. decimeter = the volume of 1 Kg of pure water at a temperature of 39.2 degrees F.

Cubic Measure

1000 cu. millimeters(mm³) = 1 cu. centimeter(cm³)
1000 cu. centimeters = 1 cu. decimeter(dm³)
100 cu. decimeters = 1 cu. meter(m³)
