DEFENDER

Food Grade

Coil Coating

- Protects against Salt Water and Corrosive Chemicals
- Bonds to all Metal Surfaces
- Withstands Temperatures up to 400°F (205°C)
- Does not hinder Heat Transfer

Part #RT640A

Features:

Defender is the toughest and longest lasting coil coating you will ever need to apply. A onetime application is all that is necessary to protect coils and other metals exposed to corrosive environments.

Defender is virtually impervious to salt water immersion, strong acids, caustic detergents, oxidation and ultraviolet light.

Defender is a clear coat that bonds to all metal surfaces and can withstand temperatures to 400°F (205°C). Heat transfer is not compromised.

Defender is NSF approved for use on food handling and food storage equipment.

Easy to use

Defender is applied by spraying from the aerosol can in a simple up and down motion. The coil should be clean and dry, and dirty coils to be treated with our **Carbonex** coil cleaning system part # RT300G, prior to using **Defender**.

Drying time is very fast, and full curing should occur within one hour in most conditions.

Clean up is simple, removal from skin and hands with soap or waterless hand cleaner, and from other surfaces using our **20/20** Degreasing Solvent part # RT380G
